As your presiding officer I had the honor to receive an appointment from the Secretary of State as a delegate to represent this Association at the Congress, and was requested by him to appoint five additional delegates from this body. In conforming to this request the following gentlemen have accepted commissions, and have received certificates from the State Department to the Congress: Dr. Nicholas Senn of Illinois; Dr. Maurice H. Richardson of Massachusetts; Dr. George Crile of Ohio; Dr. Richard Douglas of Tennessee, and Dr. Edward B. Dench of New York.

It should be the duty and pride of the separate state associations to send at least one delegate to this important meeting, and in doing this to correspond with Dr. Angel Fernandez-Caro, Secretary-General, Fourteenth International Congress of Medicine, Madrid, Spain.

### A NEW ERA IN THE HISTORY OF THE AMERICAN MEDICAL ASSOCIATION.

This session marks an era in the history of the American Medical Association, for we meet under changed conditions, and in this our trial year, while we are adjusting ourselves to the new order, we confidently ask and expect to receive not only the consideration and forbearance, but the generous help which should be accorded to this experiment in government by which we earnestly hope to avoid the embarrassments and failures that under the old régime characterized the meetings of a body so large and unwieldy as the general session.

These changes involve not only the government of the Association proper, but also a changed relationship of the state association to the national body, as well as the relationship of the county to the state organization. Under the old organization our business was transacted by delegates from state, district and local affiliated societies in the proportion of one delegate for each ten members, while now, only affiliated state organizations have the right to send delegates, and these are only entitled to one delegate for each five hundred active members, or fraction of this number. These form the House of Delegates which is further reinforced by two members from each of the scientific sections of the Association, and one each from the Army, the Navy and the Marine-Hospital Service. Under the old régime the state association bore the same relationship to the national body as did the city, county and district organizations. Now, only the state association is represented, and they create the legislative body of the American Medical Association. In other words, the House of Delegates is a federation of all the state associations.

The reorganization at St. Paul, having taken away from the county organization its right to send delegates, also deprived the city, district branches and other minor associations of the same privilege,\* requiring membership in the county society when such exists as a prerequisite to membership in the state and the American Medical Association. This ruling dropped, at least temporarily, from the rolls of the Association a considerable number of physicians who had long been on the roster from state or local bodies which, by the laws then existing, were in affiliation with the National Association. While this action may have seemed unnecessary and unjust to these members (among whom were many of the most loyal and faithful supporters of the national body) for the common good, they should yield to the opinion of the majority, since calm reflection must convince any reasonable mind that one of the wisest steps the Association ever took was when it made the county medical organizations the basis of membership in the national body. There will hereafter be excluded from

membership that fortunately small, but none the less existing group of unworthy members of our profession who, on account of the clumsy rules which formerly prevailed, obtained a place on the roster of the American Medical Association.

To the date of the reorganization in June, 1901, the roster of this Association was so inaccurate and unsatisfactory that the secretary and president-elect undertook the difficult task of obtaining a correct list of members. While one might infer that each organized state and territorial association could, from its records, furnish at short notice the names of all eligible to membership in the American Medical Association, in only a very small proportion of these subordinate bodies was a reliable list available. It then became necessary to direct a circular letter, state by state, to every name on the roster then existing, asking for the necessary information. Since, for final confirmation, these names must be referred back to the subordinate organizations in which membership is claimed, it will be seen that some time must elapse before the completion of a perfectly reliable list. The lack of business-like methods with which our profession is charged is in a manner sustained by this admission, and it emphasizes the necessity of a thorough reorganization of all the societies in affiliation with the national body, upon practically a uniform plan.

#### A UNIFORM STANDARD FOR ALL STATES.

Scarcely second in importance to a uniform scheme of reorganization is that of a uniform standard of requirements for the practice of medicine in the various states. It is of vital interest to the welfare of the profession that the question of reciprocity or interstate comity should be settled so that without any sacrifice of the very highest requirements, a physician in practice in one state, having gone before a competent board, upon change of residence might be permitted to practice without being subjected to a second state examination, in the place of his adoption. The House of Delegates will, without doubt, act upon this matter at this session.

#### THE SECTIONS.

Referring to the subdivisions of the scientific work of the Association, Article V of the Constitution empowers the House of Delegates "to authorize new sections which may from time to time be organized, as the necessity for their existence arises." With increasing membership and the consequent larger attendance, it may be imperative in the future to create new sections, but this should be done only after careful consideration, and not until it is demonstrated that the material of high scientific value offered to the twelve sections now existing is more than can be utilized in the time allotted for the meetings.

The by-laws require every member to register in one of the sections, and it would be well to limit each reader to a single paper before the section chosen. The Association should insist that the officers of sections exercise a most rigid scrutiny of the papers referred to them. If we are to achieve our high purpose, if we wish to attract to our organization the great bulk of the better element of the medical profession, we must present through our sections, papers which demonstrate not only the high scientific attainment of the author, but the undoubted value of the material presented. We are judged by our works, and if, at our meetings, and in the publication of our papers in *THE JOURNAL* which carries them to all parts of the earth, any unworthy material finds a place, it can but reflect discredit upon the Association.

#### BRANCH ORGANIZATIONS.

Article VI of the new Constitution says: "The House of Delegates shall have authority to provide for and to create such branch organizations as may be deemed essential to the promotion of the welfare of the medical profession."

For the present I would not advise the establishment of these subdivisions, but ultimately it may be found necessary to divide the states and territories according to population and geographical position into district branches where meetings may be held at the convenience of the states represented, and without interference with the annual session of the National Association.

Let us hope that the various tri-state societies and the sectional organizations, such as the Southern Surgical and Gynecological Association, and the equally successful Mississippi Valley Medical Association, and others of like character, attracted by the high and unselfish aims of this organization, may appreciate the vital necessity of a united profession and vote themselves into district branches of the American Medical Association. Truly, in such a union there would be strength so potent, and influence so far reaching that we could safeguard, without doubt, the material interests of the profession, elevate still higher the standard of medical education, secure the enactment and enforcement of just and rigid medical laws, enlighten and direct public opinion in regard to the broad problems of state medicine, and demonstrate to the world the practical accomplishment of our science.

#### PERMANENT PLACES OF MEETING.

Article VII of the new Constitution, which deals with "Sessions and Meetings," refers the place and time for holding each annual session to the House of Delegates. They are also, under Article IX, empowered to appropriate funds for defraying the expenses of the annual meeting, as well as for enabling the standing committees to fulfill their respective duties.

I would recommend to the consideration of the Association the propriety of selecting in each of the geographical subdivisions of the United States, in which the sessions are successively held, some suitable location which has been found to be well adapted to the work of the organization, and to which we could return when the meeting is again to be held in that section of the country. As a scientific body intent upon fostering the growth and diffusion of medical knowledge, it is of vital importance to avoid in the selection of our place of meeting everything that could detract from the closest attention to the scientific programme. The smaller cities with ample hotel accommodations and halls conveniently located, have always yielded a larger attendance before the sections, and consequently a greater benefit to our members than the cities of larger size with their multitude of distractions. Moreover, it seems scarcely in accord with the dignity of this great body to require through its committee of arrangements that the physicians of the state and place selected for the convention should be held responsible for the expenses of that meeting. Every suggestion of commercialism should be avoided, and this prosperous organization should assume the entire responsibility and management of these annual sessions.

#### THE COMMITTEE ON MEDICAL LEGISLATION.

One of the most important duties imposed upon the House of Delegates is the selection of those who conduct its business affairs. In the past, the Association has

shown a keen discernment in securing for its trustees and standing committees men, not only of executive ability, but held in high esteem as representatives of a profession, which, according to the Code of Ethics, "should be temperate in all things, and which requires greater purity of character and a higher standard of moral excellence than any other calling."

You will in the regular order of business hear the reports of your five standing committees, and I am called upon to speak of but one, viz.: The Committee on Medical Legislation which the by-laws adopted in June of 1901 directs to be appointed by the president, and to consist of one delegate from each state. In accordance with this requirement I mailed to the president of each state and territorial organization in affiliation with the American Medical Association a letter asking him to nominate one member for this committee. To all replies to this letter the name of the delegate was sent to the chairman of the National Committee on Medical Legislation, Dr. H. L. E. Johnson, Washington, D. C. It will be remembered that at the session in St. Paul in 1901, the Association ruled that the National Committee on Medical Legislation, consisting of Dr. H. L. E. Johnson, Washington City; Dr. William H. Welch, Baltimore, and Dr. W. L. Rodman, Philadelphia, should be continued until the meeting in June, 1902, and should have the same power to act in the interest of the Association that they had previously enjoyed. All the legislative affairs of the Association I have referred to this committee at Washington, and have authorized them to call the full committee on medical legislation for consultation, advice or aid whenever their services might be required.

#### THE UNITED STATES HEALTH SERVICE.

In his message to Congress, December, 1901, the President recommended the establishment of a Department of Commerce and Industries. In its passage through the Senate the name was changed to that of Commerce and Labor. Before the national legislature at the same time was a bill known as the Perkins-Hepburn Bill to increase the efficiency and to change the name of the United States Marine-Hospital Service to that of the United States Health Service, transferring this from the Treasury to the new department.

The American Medical Association has on several occasions expressed its desire for the establishment of a Department of Public Health, either as a separate department of the Government, or as one of the important bureaus of a department. Probably on account of a lack of thorough organization and coöperation, it has not been able to obtain this important recognition for the medical profession. In view of these repeated failures it would seem advantageous to the scheme of establishing ultimately a Department of Public Health that the Perkins Bill should become a law, because the United States Marine-Hospital Service could then with more propriety be removed from the new Department of Commerce and Labor, into a separate and independent department. This department should be in charge of a medical officer to direct our foreign and insular quarantine, interstate quarantine, the medical supervision of epidemics, and in fact, all matters pertaining to the general health of any group of states, or of the entire country.

The work of this officer and bureau can only be carried out with success by the earnest coöperation of the health officers of the various localities and states, and of the advisory board for the hygienic laboratory provided for

in the Perkins-Hepburn Bill, for the national and local authorities acting in harmony would be better able to prevent the importation of disease, and to stamp out epidemics which may occur despite the greatest vigilance, and this with the minimum disturbance of the resident public, and of the commercial interests of more remote sections.

#### THE ARMY MEDICAL DEPARTMENT.

As the representative organization of the medical profession of the United States, it is our duty to coöperate with the medical corps of the Army in the effort to procure legislation which will not only uphold the rights and dignity of the medical officers in the public service, but will give better protection to the health and lives of our troops.

The status of the Medical Department of the United States Army is fairly stated in a circular issued by the medical officers stationed in the Philippines, in which they claim that the present condition of affairs "is regarded as a menace to the efficiency of the medical department, as it is felt to be unfair and unjust." In no other staff department is promotion so slow as in the medical department. It is graded for rank, promotion and pay below every other staff department of the Army, and, with the exception of second lieutenant, is graded below the line. A medical officer, under the provisions of the present law, to obtain a colonelcy must pass through three times as many files as an officer of the Quartermaster's, Subsistence or Pay departments; through more than twice as many files as an officer of the Engineers' or Ordinance departments, and more than one and one-half times as many as an officer of the signal corps. Officers of the line, having attained the rank of major, have to pass through but four files to obtain the rank of colonel, while the medical officers have to pass through nine files. All these facts are fully appreciated by the younger physicians of our country, and by the volunteer and contract medical officers, hundreds of whom are now serving with troops and are declining to become candidates for a position offering such an unpromising career and so little in the line of promotion and emolument.

The Secretary of War has been officially informed by the Surgeon-General that the number of available medical officers is being rapidly diminished, and he anticipates he will soon be unable to supply the demand for medical officers to replace those constantly returning from the Philippines, unless the prohibition placed by the Secretary of War upon the appointment of additional contract surgeons is removed. He says: "The service would no doubt be more attractive to well-educated physicians if the prospects for promotion were better, and I respectfully commend that Congress be asked at the present session to add to the medical corps of the Army, two colonels, six lieutenant-colonels and twenty-five majors. This would give thirty-three additional vacancies and would furnish an incentive to volunteer medical officers and contract surgeons now in service to seek admission to the regular army. I would also recommend that the age limit for volunteer surgeons and contract surgeons who have rendered satisfactory service for two years or more be raised to thirty-six years."

No one who has carefully studied the subject can but conclude that under the statutes now in force many lives have been sacrificed and much suffering has resulted from lack of thorough coöperation between the officer in command and his chief surgeon, and without doubt it would be to the interest of the service if medical

officers were always consulted with regard to the location of camps and military posts for the purpose of getting expert opinion upon sanitary questions.

In order to impress upon commanding officers the importance of military hygiene, and the greater necessity for this coöperation with the medical corps of the Army, the Surgeon-General has insisted that there should be established at the Military Academy at West Point a course of instruction on military hygiene.

It is the duty of this Association to lend its best efforts to the Surgeon-General, a former president of the American Medical Association, and one not only in a position to suggest the legislation which would best serve the interests of the Army, but one whom we know to be zealous of the interests, rights and dignity of the medical officers of the War Department.

#### VIVISECTION—SMALLPOX.

The committee to whom was entrusted the question of vivisection has been diligent, and it would seem successful, in its efforts to prevent unwise and injurious restrictions upon this important method of research.

The wide dissemination of the contagion of smallpox in the United States within the last few years demands the most earnest attention of the medical profession. Such ignorance or indifference to the immunizing power of vaccination is a matter of surprise in an advanced stage of civilization and, while laws for compulsory vaccination would without doubt be to the best interests of the whole people, it seems so contrary to the spirit of our institutions as to be impolitic as well as impracticable. It falls upon us as physicians to labor unceasingly to impress upon the communities in which we reside the necessity and safety of this immunizing process.

#### THE MEDICAL PROFESSION NOT WHAT IT SHOULD BE.

We will be wise if, from time to time, we make a critical analysis of our past, realize exactly what we are doing, and upon this, base such conduct as will assure to our successors a more satisfactory condition of our profession, and a higher achievement of this Association. Being human we are too apt to shut our eyes to unpleasant truths; to exaggerate the value and the importance of our own performances, and to think that what we have been taught to believe, or what we wish to believe is right and unchangeable. Let us ask ourselves plainly: Is the medical profession of the United States what it should be? Has it won the influential position to which it should aspire? Has it gained the power to secure just and proper legislation? Has it lived up to its obligations, and has the American Medical Association, which claims to represent one hundred and twenty thousand regular practitioners of medicine in the United States, fulfilled its mission? How many of us after due reflection can consistently answer these questions other than by saying plainly and regretfully—No. And wherein lies our weakness? To say we are part of a young and scarcely organized country; that our profession is widely dispersed over vast regions so remote from each other that contact and coöperation are difficult will not entirely satisfy the fairly critical mind. Such excuses might have been sufficient at an earlier date, but not now. To say that, despite these and other embarrassments, we of the United States have given to mankind the unequalled boon of ether anesthesia; that, through the achievements of members of our profession and of this Association medical and surgical science has been greatly enriched; that great specialties recognized the world over have been developed; that operations bold

and original have been established beyond controversy; and that by reason of these various contributions to the science and art of surgery and of medicine millions of lives have already been saved, together with the merciful mitigation of suffering which all this implies. While a repetition of this may flatter our vanity, it will not wholly satisfy us when in honest purpose we realize how great are our shortcomings.

It is a fact painful to acknowledge that of the three so-called learned professions, the ministry, law, and medicine, ours is accorded the inferior position, and we who day in and out, in every home of the land, are close in the personal friendship of our patients, respected and loved as individuals, are incapable of wielding by organization and discipline the powerful influence of a united profession aiming at a high and honorable purpose. And what have been the results of this house divided against itself? Witness the snail-like progress which marked the various steps in securing our laws for elevating the standard of requirements in medical education and for medical practice: Witness the opposition to our efforts in securing better sanitary regulations, and in the struggle to protect the public from the horde of uneducated or misguided persons who, under the guise of Christian Science, Osteopathy, and other schisms, insist upon being permitted to take charge of and treat human beings suffering from disease without submitting themselves to the state examination legally required of us.

#### THE NECESSITY OF A BETTER SYSTEM OF EDUCATION AND OF A MORE THOROUGH ORGANIZATION.

There are, in my opinion, two principal causes of this evident weakness of the profession. First: The insufficient methods of medical education which have prevailed for the greater part of the first century of our national existence. Second: The lack of organization.

The Code of this Association says: "Those admitted into our ranks should found their expectations of practice upon the extent of their qualifications." We stand committed as the champion of higher medical education and the elevation of the standard of requirements applicable not only to the entrance examination, but to a rigid examination before the degree is received, as well as by the state before permission to practice is granted. To this rigid examination this Association, by its rules of conduct, demands another important essential. The highest order of learning, the greatest amount of skill may not make one an honor to our calling for "there is no profession from the members of which greater purity of character and a higher standard of moral excellence are required than the medical, and to attain such eminence is a duty every physician owes alike to his patients and his profession."

#### THE CODE OF ETHICS.

The American Medical Association is the sponsor for organized medicine in the United States, and failure to accomplish this end implies the failure of this Association. We must not fail, nor will we, unless we falter in carrying out the plan of reorganization in the liberal and progressive spirit which characterized the session of 1901. It is our plain duty to endeavor to bring about the adoption by the various constituent bodies of a practically uniform constitution and by-laws for each county, and for each state, modified only as the local conditions may require, and all governed by the same rules of conduct. These rules, as at present given in the Code of Ethics, adopted many years ago by this Association, should be also a subject of serious consideration at this time, for we can not claim consistency or be logical in

argument until there is but one code for the national Association and for all of the state organizations represented in the national body. This, as you well know, does not now prevail. Some years ago there lived and labored among us for the good of mankind and the honor of the profession a man whose genius was of the highest order, and whose fame carried the name of American surgery throughout the civilized world. He was one of those fearless pioneers in science who found his place ever on the frontier clearing the way for those who were to follow. In 1876, at the meeting of the American Medical Association, in Philadelphia, Dr. J. Marion Sims, in his presidential address, referring to the Code of Ethics, says: "The time will come when your organic laws, like the Constitution of our country, will require modifications and amendments to suit a higher intelligence, a broader education and a greater destiny." In my opinion, the time has come when we can not absolve ourselves from the responsibility of doing away with the inconsistencies for which we may now be properly criticised.

Such have been the changes in the statutes of a majority of the states since the Code was adopted by the respected founders of this Association that we find it insisting upon conduct on the part of our members which is contrary to the laws of the states in which they reside. For instance, one section forbids a member of the regular profession to act upon a board of examiners which has to pass upon the legal qualifications of persons not graduates of regular medical colleges, while in thirty-eight of the states represented here, the civil statutes require these boards which are composed in great part of members of the Association to examine, pass upon and sign certificates or licenses to practice of Homeopaths, Eclectics, and other subdivisions of medical practice. In six of the states, including the District of Columbia, the law requires three separate examining boards. In Mississippi, North Carolina and South Carolina, the examining boards are entirely composed of regular physicians, and in one of these states (Mississippi) while none but regulars are allowed on the board, the law explicitly says: "Distinction shall not be made between applicants because of the different systems or schools of practice that may be chosen." In almost all the states and territories regular physicians are compelled by the laws of the state in which they reside to disobey the injunctions of this section of the Code of Ethics.

A modification of this and other sections of the Code must be a part of the liberal plan of reorganization which we have essayed.

In conclusion, I ask this Association to stand for more than the healing art. To labor for the alleviation of suffering and for the restoration of health is a noble avocation, but to teach our fellows how to avoid disaster is a prouder privilege and a higher duty. We should be teachers of men. How better can we protect the public from disease in all its various forms and insidious processes than by perfecting in every county and in every community an organization which shall be ever watchful and insistent upon obedience to the laws relating to the public health.

**Death of Torok.**—G. von Török died at Vienna, May 20, from the results of a professional infection. He was in his fifty-third year and had been at the head of several Vienna military or civil hospitals in turn. His last work was on the necessity of treating severe cases of tetanus with injections of antitoxin not only under the skin, but directly into the brain and spinal cord.

## Orations.

### THE RELATION OF MEDICAL SCIENCE TO COMMERCE.

ORATION IN MEDICINE, DELIVERED AT THE FIFTY-THIRD ANNUAL MEETING OF THE AMERICAN MEDICAL ASSOCIATION, HELD AT SARATOGA SPRINGS, N. Y., JUNE 10-13, 1902.

FRANK BILLINGS, M.S., M.D.  
CHICAGO.

I have been informed that there is no rule of the Association which fixes the subject of this address. I hope I may be pardoned when I depart from the custom which my predecessors have usually followed when they confined the subject of the address to the progress of medicine during the year just past.

We live in a period of the greatest activity of the history of the world. Modern inventions annihilate time and distance. Electricity and steam approximate the most distant parts of the civilized globe. Vast amounts of capital are invested in electrical, steam and other related interests.

Large commercial enterprises are carried on or launched into new fields, which require money, the employment of the brightest intellects and skilled and common labor.

Competition is great in all the affairs of men. The struggle for supremacy between nations and between men was never so fiercely contended as now. The world is richer than ever before. Great individual fortunes, the result of the efforts of the few years of a single span of life, are seen everywhere. The wage of the laborer in our country is larger than ever before and he may command the necessities as well as many of the comforts of life.

This modern restless activity, with its nerve-racking; the evil results of a luxurious life; the moral obliquity which it may breed, as well as many other conditions which affect the health of individuals, while of interest to medicine, do not concern us in the consideration of the broader subject of this paper.

#### THE BROADER APPLICATION OF MEDICAL SCIENCES.

Medical science is interested in and is of greater importance to the world than ever before, in protecting individuals, states and nations from infectious diseases, which are rendered more dangerous than formerly because of a denser population, increased facilities of communication between the peoples of the earth, by travel and by national and international interchange of food and other commercial products.

Medical science, too, is closely identified with the vast monied interests of the merchant marine and of national and international commerce. Quarantine against the spread of infectious disease is applied wisely or foolishly in direct ratio to our knowledge or ignorance of the cause, the means of transmission and the evolution of disease. So, too, medicine has to do with the knowledge which will enable man to escape from and finally remove the conditions which cause infection and which render a country uninhabitable to civilized man.

Medical science must safeguard man against infection and intoxication from parasitic diseases of animals used for food and from contaminated and adulterated food and drink. Not only from a humanitarian standpoint is medical science related to commercial pursuits, but the sciences related to medicine have done much to preserve animals used for food and to protect many agricultural interests from disease and destruction.

One may say, I think, that in no other pursuit which engages the serious attention of men are there as many earnest, unselfish and philanthropic workers as there are to-day in the broad field of medicine.

In the various departments of science related to medicine one finds educated, skilled, energetic, earnest workers after truth, willing to sacrifice home, friends, health and life for the advancement of the science which has for its primary object the conservation and prolongation of human life. Pecuniary reward for them is never large and never commensurate with the character of the work.

Furthermore, great and astounding as are the modern commercial inventions, the progress made in medical science during the last twenty years is equally great.

Is modern medicine prepared to meet the demands of modern progress concerning the questions which interest humanity and commerce? Let us answer the question by a brief retrospect of the progress of medicine and by a statement of the present status of medical science.

#### FIRST APPLICATION OF PHYSICAL SCIENCES TO MEDICINE.

From the latter part of the eighteenth to the beginning of the last quarter of the nineteenth century the science of medicine developed steadily upon a rational physical basis. Jenner's discovery of the protection of the human race against variola by vaccination with cow-pox, illuminates with noonday splendor an era otherwise gloomy with its hypotheses, theories and superstitions concerning disease.

This single brilliant achievement of the end of the eighteenth century was the beginning of the evolution in medical science which made the nineteenth century notable. The application early in the nineteenth century of physics, of physiology, of pathologic anatomy and of chemistry, to the study of disease, developed a more exact knowledge than before existed. To Auenbrugger that early period owes much through the discovery of methods of physical examination which were slowly developed and perfected by Corvisart, Laennec, Piorry, Skoda, Wintrich, Traube, Louis, Cheyne Stokes, Graves, Corrigan, Flint, Scudamore and others. Pathologic anatomy made wonderful strides under the labors of Virchow, Rokitansky, Arno'd, Stillé and their students. Physiology was developed by the labors of Johannes Müller, Brücke, Helmholtz, Trousseau, Vierordt, Foster, Carpenter, Magendie, and their disciples; and the fuller knowledge embraced in physiologic chemistry was added to the rapidly-broadening field of medicine by Hoppe-Seyler, Schwann, Stricker, Prout, Liebig and others.

#### BACTERIOLOGY.

The development of the microscope during the second and third quarters of the past century added a mighty weapon to the armamentarium of the physicist. The microscope was an aid to the investigators of pathologic anatomy, of physiology, of chemie physiology and of other subjects, and it was the one necessary means by which the teeming world of bacteria was made visible. This discovery and the knowledge which has come from a study of these infinite and yet often mighty beings has revolutionized medicine.

It was Pasteur's brilliant studies of the infective microbes of air which led to the discovery of the source of contamination of wounds and which made it possible for Lister to evolve a method of protection of wounds from air infection. The aseptic surgery of to-day is but the evolution of Listerism which had its basis of existence in the discoveries of Pasteur. With the micro-

scope Pasteur rid the world of the superstition of spontaneous generation. He proved the infectiousness of dust-borne air through the microbes it carried. He blazed the way for others in the study of bacteria as agents of putrefaction, fermentation and of pathologic infection in animals.

Bacteriology became an exact science with the discovery of Robert Koch of cultural methods which made differentiation of bacteria possible. The causative relation of bacteria to all infective processes was practically proved by the laws promulgated by Koch. In twenty years the bacterial cause of tuberculosis, typhoid fever, cholera, diphtheria, pneumonia, pyogenic processes, erysipelas, gonorrhea, epidemic meningitis, epidemic dysentery, the plague, charbon, glanders, tetanus, influenza, and lepra has been proved.

#### PARASITES.

The discovery of the hematozoön of malaria by Laveran; the recognition of the ameba of dysentery by Loesch; of the ray fungi and especially the actinomyces as infective agents in the lower animals and in man, and the more exact knowledge of other animal parasites infecting man and animals, which the microscope has made clear, have been as epoch-making in parasitology as the discoveries of Pasteur and Koch in bacteriology.

The recognition of the relation of bacteria, protozoa and animal parasites to infective disease has been the means of a more exact knowledge of the clinical phenomena of disease, of morbid anatomy, of physiology and of physiologic chemistry than would have been possible without it.

#### TRANSMISSION OF INFECTION.

The knowledge of the cause has led to a study of the life-history of infective organisms outside of as well as in the animal body. The mode of propagation, the means of transmission of infective micro-organism, by fomites and other agents, has become known. The rôle which insects which infest animals play as definitive or intermediate hosts, has been studied and proved. The discovery of Manson of the transmission of *Filaria sanguinis hominis* by the mosquito was of vast importance as a suggestion of the mosquito as a definitive host in malaria. The investigations of Manson, Ross, Celli, Grassi, Dionise, Marchiafava, Bignami, Koch and others have made our knowledge of malaria exact. With the microscope we may now not only recognize malaria and differentiate it from the other infective fevers, but we may also at the same time recognize by an examination of the blood the type of malarial infection and foretell its course. Not only may we recognize the disease definitely and apply the drug treatment more rationally, but the knowledge of the means of its transmission from man to man enables us to apply preventive measures which, as we shall see later, are of the greatest importance from a commercial as well as from a humanitarian point of view. The recognition of the rôle of the mosquito in malaria has been, furthermore, a stimulus to the study of the same insect in relation to other infections.

The brilliant research work of our own Reed and Carroll in 1900 in Cuba, by which they proved that the mosquito of the genus *stegomyia* is the sole means of the transmission of yellow fever from man to man is of great importance as a scientific fact. The influence of this discovery upon mankind as a prophylactic against a disease which has killed multitudes and also from a monetary point of view, in reference to commercial pursuits, is not appreciated at this time as it should be.

Hardly less important is the fact that the *Bacillus pestis* may infect fleas and these in turn infect rats, mice and man. It is important, too, to know that pests like the house fly may be carriers of infective bacteria from refuse filth to our kitchens and tables and contaminate food and thus infect us with typhoid fever, cholera and perhaps other diseases which are propagated by filth.

The study of bacteria in the laboratory and in the blood tissues of infected animals has led to the discovery of the means by which bacteria disturb the animal economy and produce phenomena expressive of disease. The fact that the blood and tissues of infected animals contained a toxin which could also be isolated from pure bacterial cultures in the laboratory and that this toxin when introduced into an animal was capable of exciting the same phenomena of disease as the bacteria themselves, was positive proof that bacteria excite disease phenomena by means of a toxin which they form. The elaboration of antitoxins in the body of the infected animal was also promptly recognized and served to explain not only the self-limitation of many of the infective diseases, but it also helped us to understand the immunity which one attack of some of the bacterial diseases affords.

#### PROTECTIVE INOCULATION.

Long before bacterial toxins were recognized as the cause of disease phenomena, Pasteur established the principle of protective inoculation with bacteria of lessened virulence, which was brought about by attenuation of the bacteria by a modification of cultural methods and also by serial inoculation of certain lower animals. This he successfully applied to charbon in sheep and cattle and to chicken cholera. In both of these diseases the bacteria were known and the problems of attenuation could be carried on in the laboratory by direct study of the bacteria before inoculation and afterward when they were recovered from the bodies of the animals experimented on.

His final life's work was no less important, in firmly fixing the immunizing influence of attenuated bacterial inoculation in rabies. Here the discovery of the infecting bacterium escaped every known means of recognition by examination of the tissues and blood of the infected animals microscopically and culturally. Apparently there are pathogenic bacteria which we do not know because we have not yet recognized the proper culture material for the successful artificial cultivation of them, nor have we discovered the tinctorial reaction which they may possess and, finally, it is not improbable that they may be infinitely smaller than other bacteria and, therefore, more difficult to recognize.

Pasteur recognized the fact that in hydrophobia the brain and other nervous tissue of an infected animal are capable, when inoculated into another animal's brain, of producing the disease. That the infected brain, used for inoculating animals, contained the bacteria, which caused the disease, was proved by the fact that a stage of incubation occurred in the inoculated animal and that a series of animals were successfully inoculated consecutively from the first. Pasteur then successfully attenuated the unknown bacterium of hydrophobia present in the nervous tissues of an inoculated animal by desiccation of the nervous tissue in a sterile apparatus by methods too well known to repeat. Nor is it necessary to occupy too time in repeating the well-known methods pursued by Pasteur and his pupils in the use of the graduated doses of attenuated bacteria contained in the nerve tissues in the prophylactic treatment of rabies.

To Pasteur, therefore, do we owe the scientific recognition of the principle of protective inoculation.

It is now a well-known fact, however, that inoculation against disease was practiced by the Chinese 1000 years ago. They inoculated the healthy with smallpox as a protection against the disease. Variolization was also practiced in Europe in the seventeenth and eighteenth centuries. We read that in 1718 Lady Montague caused a son to be inoculated with variola in Italy and that two years later her daughter was inoculated in England. The practice was followed in Ireland long after the successful establishment of vaccine as a protection against variola. Inoculation against syphilis, or syphilization, was also practiced in Europe during the nineteenth century.

To Jenner, however, do we owe the first example of the protective inoculation by means of an attenuated virus. This attenuation we now know was established by the accidental inoculation of milch cows with smallpox, producing a modified disease, vaccinia. That vaccinia, produced in man by inoculation direct from the cow, would protect against smallpox was proved when in 1798 Jenner successfully vaccinated, direct from the cow, the five-year-old lad William Summers.

The thousands of successful vaccinations which have since been performed and the thousands of lives which have been saved by vaccination are proof of its validity and utility. The immunity established by protective inoculation is apparently the same as that induced by an unmodified attack of variola.

#### SERUM THERAPY.

When chemistry had revealed the nature of bacterial poisons and experiments established their relation to the phenomena of disease, it was proved that substances were formed in artificial culture media and in the blood and tissues of infected animals which had the power to neutralize the effect of the bacterial poison in other animals infected with the same organism. Further investigation showed that an animal inoculated with the laboratory preparation of antitoxin was protected against the disease.

Furthermore, it was found that the blood serum of an animal inoculated with bacteria in a non-fatal and repeated dose contained an antitoxin. When the blood serum of the infected animal was injected into a healthy animal, the latter was protected against the original disease.

Antitoxin was, therefore, proved to be formed in artificial media of bacterial cultures and in the bodies of infected animals. When the antitoxin thus formed was injected into an animal it had the power to protect it against the particular bacterial infection or, if given subsequent to the infection of the animal, to mitigate the severity of the disease or to entirely check it.

Thus, by Koch and his students, was serum therapy established as a principle. Upon this principle there has been established and given to the world the antidietheritic serum of Behring and of Roux.

A curative or immunizing serum has been developed for Asiatic cholera, tetanus, erysipelas, plague, epidemic dysentery, streptococcus infection and other diseases. While the serum treatment has not proved successful in all the diseases in which it has been used, it has been so successful in some—diphtheria, for instance—as to firmly establish the principle of serum therapy.

#### INFLUENCE OF BACTERIOLOGY UPON PRACTICAL MEDICINE AND SURGERY.

These practical results in specific prophylactic and curative therapy are but a part, however, of the influ-

ence which bacteriology has had upon medicine. The stimulus, given by bacteriology to the study of pathologic anatomy, physiologic chemistry, clinical phenomena and of physical and chemical changes of the fluids and tissues of the body, has resulted in a knowledge so comprehensive that medical science has been revolutionized within the last twenty years. Speculative theories and hypotheses have given place to facts based upon sound principles proved by experiment and clinical observation.

Bacteriology made possible the comprehension of perfect cleanliness and enables the surgeon to invade every part of the body without fear of infection and has saved thousands of lives which twenty-five years ago perished miserably as the result of disease at that time inoperable, or the result of infection from contact with the surgeon. By means of cleanliness and skill, induced by a broader experience, the surgeon has been able to add to our knowledge information of great value which could have been obtained probably in no other way. He has been able to study disease in the living body and show the relation of a disease process to infection. He has thus been able to clear away many of the misconceptions of symptomatology and diagnosis, especially in disease of the abdominal organs.

Bacteriology has stimulated laboratory clinical diagnosis. Bacterial reaction to sera and blood cultural tests are of the greatest aid to diagnosis. Clinical research work has command of an armamentarium consisting of a knowledge of pathologic anatomy, of physiology, of bacteriology, of chemic physiology and of physics, which allows of a precision in diagnosis never before at the command of the physician.

From the foregoing it seems sufficiently demonstrated that to-day medical science possesses a knowledge so exact that we may answer definitely the question of our relation to the commercial affairs of the world. Infectious diseases which affect agricultural interests, like swine plague, rind pest, fowl cholera, glanders, tuberculosis, actinomycosis, trichinosis, and many of the parasitic diseases of plants and of animals have been studied by scientists with most definite results.

#### PREVENTION OF INFECTION.

To-day no sane man believes in spontaneous generation. The presence of an infective disease either bacterial, protozoic, parasitic or fungous, means the recognition of progenitors in the near environment of the infected organism. In practically every one of the diseases of animals above named the scientific investigator has already discovered the nature of the infecting agent, knows its life-history, what conditions are most necessary for its propagation and multiplication and what will remove and annihilate so dangerous an enemy.

Our Department of Agriculture, and especially the Department of Animal Industries, has done much to place comparative medicine on a scientific basis. Briefly stated, there is not a fungous-parasitic, animal-parasitic, protozoic or bacterial disease of the lower animals which can not, with our present knowledge, be stamped out for all time.

Why do the acute epidemic infections attack the swine, fowl, and cattle of the agriculturist? Because the causative germ is allowed to live and multiply after a former epidemic, or, it is transplanted from place to place by infected animals or by fomites. All of these acute diseases of the lower animals are preventable. One has but to read of the labors and investigations of Pasteur, in relation to charbon, to the silkworm disease and to fowl cholera to know what indifferent careless methods

may do to prolong and propagate an infection. On the other hand, proper precautions as to the destruction by fire of the infected bodies of animals and plants, the application of cleanliness through the use of abundant pure water, pure food, air and sunlight would extinguish an epidemic.

This may imply the loss of infected property by the individual, the municipality, the state or the national government, but fall the loss where it may, it is often necessary to destroy absolutely the infected organism that the greater commercial interests as well as the health of the people may be preserved. For example, actinomycosis of cattle, trichinosis of swine, tuberculosis of cattle, may be absolutely controlled and finally obliterated by proper sanitary measures. The expense of such an undertaking would be relatively great, but under the direction of scientists it can be done. Pasteur, with the aid of the government of France, abolished swine plague, charbon, silkworm disease and other conditions harmful to the agricultural interests, with the result that millions of francs were saved to individuals, to corporations and to the government.

The same happy result would occur here and in addition the health of our people would be protected against the possible infection with tuberculosis, actinomycosis, trichinosis and intoxication from other infected animal foods.

#### SMALLPOX.

But what of the epidemic scourges of the earth, smallpox, yellow fever, cholera and the plague? No rational individual can, for a moment doubt the protective influence of bovine vaccination against smallpox. Let one but look up the statistics of the mortality of this disease in the anti-vaccination period and he will become convinced of the utility of protective vaccination. In London the annual mortality from smallpox from 1660 to 1810 per million of the population was 2040 to 5020, while with vaccination, not adequate, however, the death rate per million was from

|                          |     |
|--------------------------|-----|
| 1831 to 1835 .....       | 830 |
| 1838 to 1853 .....       | 513 |
| 1854 to 1871 .....       | 388 |
| 1872 to 1882 .....       | 262 |
| 1883 to 1892, only ..... | 73  |

In Germany where variola had decimated the population in the prevaccination period, thorough vaccination has practically stamped out the disease. Compulsory vaccination properly enforced would effectually eradicate the disease and would free commerce of the losses due to quarantine regulations. The question of individual rights, especially under a republican form of government, is debatable when one considers that science has proved the efficacy and utility of protective vaccination against variola; that with modern methods the process is free from the danger of inoculation with any other disease; that vaccinia is practically a harmless disease and, finally, that an individual right may become an evil when the practice of it subjects others to unnecessary risk of health, life and property.

Medical science, therefore, possesses the knowledge to rid the earth of variola. From a humanitarian point of view, this knowledge is priceless. Still, let one but compute the sum saved to the nations of the earth by vaccination, estimating each life saved at \$5000, the usual valuation placed upon human life by statute. Great as would be this sum, it is many times less than that saved to the commercial interests of the world by the control of the disease which even inadequate vaccination has afforded. Think for a moment of the loss to

commercial interests by quarantine and other restrictive measures, in the event of an epidemic of variola, without protection from vaccination.

#### THE PLAGUE.

The plague, the Black Death, which was first recognized in Europe in the year 543 as the *Peste Justinienne*,<sup>1</sup> became pandemic in the fourteenth century and 24,000,000 people are said to have died of it. In 1655, London alone lost 70,000 people from the plague. It disappeared from Europe about 1720. It continued, however, in Egypt, Asia and other Eastern countries in small foci, occasionally occurring as severe local epidemics. In 1830, 60,000 people died of the pest in Bagdad. During the remainder of the nineteenth century it appeared sporadically in Asia, Turkey, Tripoli, Persia and other Asiatic countries. In 1891 it reappeared in epidemic form in middle China. From that date to the present time it spread over China, reaching Canton in 1894, Hong Kong in epidemic form in 1896, and in Bombay the same year. It appeared in Oporto, Spain, in 1899; in Glasgow in 1900 and in San Francisco in 1901, not to mention sporadic cases elsewhere in seaports of Europe and Central and South America.

In 1894 Dr. Yersin, Director of the Pasteur Institute at Hong Kong, discovered the *Bacillus pestis*. He elaborated a serum which has since been used with success as a prophylactic and curative agent. Haffkine prepared a protective vaccine which has also proved successful as a protective inoculation. It has been used in hundreds of thousands of cases in India with no harmful results and is said to reduce the susceptibility at least 75 per cent. and the mortality about 90 per cent.<sup>2</sup>

The plague, the Black Death of the fourteenth century, still exists and rages with fearful mortality in communities which have no regard for hygienic surroundings. It is communicated to people through the abraded skin, or by flea bites, through the respiratory tract apparently by bacteria in dust-laden air and also through the alimentary tract by contaminated ingesta. Modern hygienic measures, which consist of perfect cleanliness, isolation, the destruction of vermin and the use of Haffkine's vaccine as a prophylactic and Yersin's curative serum, serve to control the disease. There can be no doubt that if sanitary authorities will take proper precautions to recognize the disease, proclaim its presence and then control it by the means which science has discovered, that the terrible scourge may be safely held in check and finally abolished from every civilized community.

The value to commerce of the discoveries of science in relation to the plague can not be computed. While the knowledge of its cause and prevention is exact, the impossibility of controlling the unsanitary conditions of the countries of the East and even of our own western world makes it necessary to continue the quarantine regulations which so often restrict commercial ends.

#### YELLOW FEVER.

The mortality from yellow fever in the United States during the last one hundred years, 1798-1897, has been about 80,665.<sup>3</sup> This gives an average annual mortality of 807. Several severe epidemics have occurred and it has prevailed extensively in smaller towns where the mortality records have not been kept. Hence the above figures do not represent the full annual death rate from

the disease. Yellow fever has been the scourge of the West Indies, Central and South America, Mexico and of our Gulf States.

Recognized as an infective disease, indefatigable search has been made for the bacterial cause by many earnest workers. Apparently up to the present time the specific infective germ has not been found. Indeed, from a recent paper<sup>4</sup> by Reed and Carroll, it would seem that the bacterium must be infinitesimally small.

Although we do not know the specific bacterium of yellow fever, a most brilliant discovery has been made of the means of transmission of yellow fever by means of the mosquito (*Stegomyia fasciata*) by two of our countrymen:<sup>5</sup> Walter Reed, Surgeon U. S. A., and James Carroll, Contract Surgeon U. S. A. Twenty years ago Finley associated the transmission of yellow fever with the mosquito, but no proof of this was given until the epoch-making and decisive experiments of Reed and Carroll. Furthermore, these experimenters proved that fomites contaminated with the vomitus and discharges of yellow fever patients do not transmit the disease to man.

In Havana, Cuba, the sanitary authorities of the United States have attempted during the last year or more to test the fact of yellow fever transmission by the mosquito. To this end the city was made clean; the breeding places of mosquitoes in and about Havana were destroyed as far as possible and persons suffering from yellow fever were isolated and protected from the mosquito. Thus the number of mosquitoes were much diminished and care was taken that remaining mosquitoes did not become infected by biting yellow fever patients. As a result yellow fever disappeared from Havana and for the first time in years no case had occurred up to May 1 of this year. The usual marine quarantine regulations of the United States restricting the non-immune travel from Cuba was postponed. Furthermore, the Congress of the United States will probably modify the quarantine regulations in reference to yellow fever to meet the more hopeful conditions which the researches of Reed and Carroll have established in relation to the definite transmission and control of the disease.

There can be no doubt of the practical value of this important discovery to mankind. Proper sanitary measures in reference to cleanliness, the destruction of mosquitoes and their breeding-places and proper precautions against the infection of the few undestroyed mosquitoes by isolation of every imported case of yellow fever will eradicate the disease from every civilized country.

#### MALARIA.

Malaria has not borne as important a relation to commercial communications between peoples as yellow fever and the plague. Nevertheless, it has had an enormous influence upon the health and prosperity of the inhabitants of certain regions where it is endemic and at times epidemic in its prevalence. The principles which prevail to induce malaria in a certain region is the existence of human malaria and of the mosquito of the genus *Anopheles*.

The mosquito is annoying but harmless until she becomes infected with malaria by biting a human being infected with the disease. Such an infected mosquito may inoculate all the people she subsequently stings. In this manner a region ordinarily free from malaria may become infected by the importation of a case of malaria from a distant point. It is also possible that

3. Obtained from the records through the kindness of Surgeon-General Walter Wyman, U. S. M.-H. S.

4. The Etiology of Yellow Fever, Am. Med., Feb. 22, 1902.

5. Experimental Yellow Fever, Trans. Assoc. Am. Phys., vol. xvi, 1901.

a mosquito infected with malaria could be transported by railroad or ship in the luggage or clothing a considerable distance and then sting and infect individuals in its new environment.

We have many examples of infection of people in localities usually free from malaria, through its introduction by means of imported laborers employed in the construction of railroads, canals, etc. Malaria was rarely found in Chicago until 1891 when the construction of the World's Fair buildings was commenced. Then it was attributed to the excavations and the turning of virgin soil. The construction of the Chicago Drainage Canal began at the same time and continued until 1900. During that period malaria was constantly present in Chicago and in 1898-9 was augmented by importation of infected soldiers from Cuba and other malarious regions. No one can doubt that malaria was imported in the persons of some of the foreign laborers employed in the above-named enterprises and that the previously innocent anopheles became infected and afterward inoculated many people who suffered from malaria at the period named.

The mortality of malaria in malarious districts with a considerable population is large. Thus Professor Celli<sup>e</sup> says that the mean mortality from malaria in Italy is about 15,000 victims annually, and that about 2,000,000 cases occur in Italy each year. As the mean duration of malaria is generally long, sometimes infecting the individual for years, the loss of labor and of production and the expense entailed in dealing with the disease, amounts to several millions of francs. Furthermore, Celli says that owing to malaria about 5,000,000 acres of land remain uncultivated with a resulting large economic loss. According to the very accurate calculations of Ricchi, the Adriatic Railway Company with 1400 kilometers of road and employing 6416 men, spend on account of malaria alone 1,050,000 francs a year. In the Italian Army in the twenty years from 1877 to 1897 there occurred more than 300,000 cases of malaria. Finally, Celli<sup>e</sup> says malaria annually costs Italy incalculable treasure.

Malaria is so widely disseminated over the world and the opportunity for continued infection of the mosquito so great that it seems almost hopeless to try to eradicate the disease. The principle upon which malaria may be fought has been suggested by science and has proved of value. This consists of the destruction of the mosquito and its breeding places. The prevention of the infection of the remaining mosquitoes by isolation of the malarious individual from the mosquito and the diminution of malarial material in man by an attempt to cure him with quinin and other anti-malarial remedies.

Experiment has already demonstrated that non-immune individuals may live safely in the most malarious districts, with adequate yet simple protection from the sting of the mosquito infected with malaria. Man thus protected against malaria may now explore, settle in and develop regions of the earth hitherto inaccessible because of the danger from the deadly tropical malaria.

This address would become too long were one to take up other infectious diseases, although in some of them the science of medicine has made such successful investigations that the knowledge of the cause, means of propagation and dissemination is exact.

#### TYPHOID FEVER.

I can not close without saying that if in typhoid fever we could employ, unembarrassed by the great cost of the necessary measures, the precautions which science affords

to prevent water and food contamination, that the disease would be effectually abolished. The great cost of the measures necessary to stamp out typhoid fever would, however, be an economic measure, inasmuch as the immense value to the state, of the conservation of the labor of the thousands sick and the lives saved each year would more than compensate for the treasure spent.

#### VALUE OF MEDICAL SCIENCE NOT RECOGNIZED.

However much medical science has done for humanity and great as the value of the knowledge of infectious disease is to the commercial interests of the world, scientists have not, especially in our own country, received the recognition and financial aid from the state, from corporations or from wealthy individuals which they deserved.

#### MEDICAL SCIENCE SHOULD RECEIVE FINANCIAL SUPPORT.

Medical science should receive the moral and financial support of states and municipalities in the employment of the measures which science has proved to be efficacious in modifying, restricting and abolishing infectious disease. Wealthy corporations and individuals should establish institutes of original research in properly-constructed and equipped hospitals and laboratories. There the many earnest, indefatigable and conscientious medical investigators could make more perfect the knowledge we already possess of many of the infectious diseases and, unembarrassed by financial needs, could search for the cause, the means of transmission and the prevention and cure of the diseases of which we know but little.

Funds, too, should be created to support the cost of committees of scientific investigators in regions now dangerous to the white man. By such means the many plagues of the tropics would be investigated and conquered. Regions uninhabitable or dangerous to the Caucasian would become accessible to settlement and commercial intercourse. Civilization, humanity and commerce would be advanced and multiplied.

It is right, therefore, that medical science should demand of the monied interests of the world the recognition which, though long withheld, is her just due. This she asks, not that individuals may profit in either fame or fortune, but that she may the more readily rid the world of infectious diseases for the sake of humanity.

#### SUTURE OF HEART WOUNDS.

ORATION ON SURGERY, DELIVERED BEFORE THE FIFTY-THIRD ANNUAL MEETING OF THE AMERICAN MEDICAL ASSOCIATION AT SARATOGA SPRINGS, N. Y., JUNE 10-13, 1902.

HARRY M. SHERMAN, A.M., M.D.

Professor of Surgery, Medical Department of the University of California; Surgeon to St. Luke's Hospital; Orthopedic Surgeon to the Children's Hospital.  
SAN FRANCISCO, CAL.

#### THE RECORDED SUTURES OF THE HEART.

In 1896 three operations for the suture of wounds of the heart muscle were done. Two are recorded as having been done in 1897. Four are credited to 1898. In 1899 the heart was sutured eleven times, in 1900 three times, and in 1901 nine times, three of this last set being done in this country. This year two operations have thus far been reported. This makes a total of thirty-four operations in the six years following the first attempt to treat, by a simple surgical procedure, an organ usually supposed to be particularly vulnerable, in fact, so vulnerable that any interference, even for surgical purposes, might be followed by immediate fatal results.

There is more than enough material here for our consideration at this time, and I beg you to follow me in the necessarily brief discussion which I offer you.

In order to start with some knowledge of the results of these operations, before any discussion, in general or in detail, is attempted, a short review of them will be necessary.

#### REVIEW OF THESE CASES.

As regards the manner of wounding, all these cases, except two, were due to punctured or incised wounds, the two exceptions being bullet wounds. The particular injury to the heart was inflicted on the ventricles thirty-two times, the left ventricle being implicated seventeen times and the right thirteen times. In two cases only were auricles opened, once the right and once the left, and there are three cases in which my information is incomplete. In most of the cases where details are given the pleura is reported wounded, and usually there was a hemothorax, the collection representing, in large part, the overflow from the pericardium.

The practical questions which usually come to the mind of a surgeon in planning an operation to meet these conditions, relate to the method of exposure of the heart, the detail of the treatment of its particular condition, and the method of closing and dressing the wound of the operation.

In the cases reported the heart was reached variously, depending on the location of the original wound in the skin and the choice of the operator, but either a flap of all of the tissues of the thoracic wall was turned up, or a resection of two or more ribs was practiced. The particular detail is of no great moment provided that the heart is properly exposed. The special method of treating the heart wound is of interest for it involves the choice of suture material for a novel situation, the time at which the suture is introduced and tied with reference to the heart beat, and the depth of the stitch in the heart muscle. In our cases three operators are recorded as having used catgut, Fontan of Paris, Marion, and Launay; in all other instances where the suture material was specified silk was used, and in most cases the sutures were interrupted, though in a small number a continuous suture was practiced. It is of interest to note that these operators particularly avoided including the endocardium in the suture. One of them definitely reports introducing and tying the suture during diastole.

As regards the closure of the wounds—the tissues involved in the flaps or incisions were, of course, replaced: in seven instances drainage of the pericardium and pleura was practiced, and in four the pleura alone was drained. The other cases are said plainly to have been closed without drainage, or nothing is said of the matter at all.

#### RESULTS OF THESE CASES.

Now, of the total number of these cases five died on the operating table, of hemorrhage, and ten died very soon afterwards of the effects of hemorrhage or the shock of the operation: so that nearly half of the cases that survived the injury long enough to be subjected to operation died during or very shortly after that operation. The other group, nineteen in number, had various fortunes, but thirteen of them recovered and only six died. I think it is fair to stop a moment and consider these facts. Surely the fifteen who died of hemorrhage or shock with operation would probably have died of hemorrhage exactly the same without operation. No fatal traumatism is inflicted by exposing the heart: and

stopping the hemorrhage from an incised or punctured wound in the ventricles is a simple matter when the heart is once exposed; indeed, pressure with the finger or a tampon will stop it temporarily. At all events the operation and suture did not add materially to the amount of blood lost and so can not be counted as having hastened the death from hemorrhage, and the average amount of shock I can not estimate. But I believe that it is fair to say that these patients had, from the first, practically no chance to recover, and that, if this had been known, the operations need not have been done—but I say this with full appreciation of the fact that the inevitable fatality could not have been definitely predicated in any case. Of the other nineteen, the comment is, plainly, that they had a chance to recover. In each of them the suture of the heart was a successful procedure: in not one instance was the fatal outcome due to a secondary hemorrhage. The six who died succumbed to the common matter of an infection, sequent to wound and operation. Of the thirteen who recovered four did so in spite of a concurrent infection. But the point is that of these thirty-four cases, fifteen had, really, but very slight expectation of benefit from the operation and died probably neither in spite of it nor because of it—nineteen had expectation of recovery from operation, and in thirteen that expectation was realized.

I do not wish you to think that I am trying to make these cases give a better percentage of recoveries than they really do. That percentage, as the whole list stands now, is about one-third. But if we wish to consider only the final success or failure of the suture of the heart muscle we must limit our inquiry to the cases in which this procedure was really tested, and then we see that the percentage of recoveries may be considered a little more than two-thirds.

#### SLOW ADVANCE IN HEART SURGERY.

The road to the heart is only two or three centimeters in a direct line, but it has taken surgery nearly 2400 years to travel it, for I take it that the operation of opening the chest for an empyema, which was known to Hippocrates, was a direct predecessor of the attempt to treat other thoracic viscera. It does not need to be said that during most of this time surgery stood still and that the advances were little by little. We all know that before the antiseptic and aseptic eras pleurotomy for empyema gave very terrible results, and there could be but scant encouragement to draw surgeons to fresh fields. However, more than a century ago (1798) Desault, with the logic and precision which still characterizes the French school, laid down the rules for opening the pericardium for an empyema situated in that sac, and anticipated much of the technic of to-day, and it took surgery ninety-eight years to pass from the pericardium to the epicardium, across a space that is such only potentially.

It is a little odd that surgeons have hesitated so long to go to the aid of the wounded heart in man. Physiologists for years have experimented on the hearts of animals selected from nearly all the species of the animal kingdom. The special references to this matter are not needed here, but it is germane to the subject to note that the tolerance of the mammalian heart for manipulation, and its persistence of action in spite of wounds and obstacles, have long been known.

The experience of the various operators has been, as might therefore have been expected, that the heart of man was no more resentful of intervention than were the hearts of other mammals, and that it not only could be

handled, and even partially lifted from the pericardium, but that its muscle could be sutured so as to close a wound, just as can be done with the skeletal muscles. However, in the case of the systemic muscles rest can usually be enforced, either completely or partially, during the process of healing, but this can not be done with the heart. Here comes the great difference between the heart muscle and the skeletal muscles, both as regards suture and the reparative process, the heart must continue to act for the whole of the time.

The question now centers, first, on the possibility of properly suturing, that is, placing a practical suture in the moving heart, and second, on the result of the healing process. The first question is one of only technical moment, for the work on animals has shown that it can be done, and the experience of those who have sutured the human heart has not disclosed any special difficulty in the procedure, but the matter and manner of the sutures are debatable. The general advice is that the sutures of muscle should be of silk and it has been most frequently used in the heart muscle, but three of the successful cases, the two of Fontan's and the one of Launay's, were sutured with catgut. Elsberg has advised, as the result of his experiments on rabbits and dogs, that the suture material should be silk, and that the suture be an interrupted one, and very superficially placed, believing that deep sutures will tear out while superficial ones will hold. He also advises that the suture be placed and tied during the diastole of the heart.

#### EXPERIMENTAL RESEARCH.

To discover, if I might, the exact value of these somewhat confused matters, I have exposed the hearts in eleven dogs, and made wounds of various sizes and in different directions in the left ventricle, limiting myself to that particular cavity as it was the one most frequently wounded. In each instance, except perhaps one, I verified the opening of the cavity of the ventricle by passing an instrument into it so as to get a free spurt of blood during one or two systoles. It was found that this verification was a practical necessity, for the non-penetrating wound of the myocardium will give forth, during systole, a spurt so large that it could easily be confused with one from the cavity of the ventricle. These wounds were then sewed with ordinary commercial cumolized catgut; in some deep and superficial stitches were combined; in some very deep, so as to surely penetrate the endocardium, were used, and in others very superficial stitches; and the variations of interrupted, continuous and recurrent continuous were practiced.

In the earliest operations toothed thumb forceps were used to pick up a few muscular fibers to steady the organ for the making of the incision and placing the sutures. At the first pinch the heart, of course, delayed a systole and then began to beat rapidly and violently and continued this as long as the forceps were in place. It was exactly as if the heart were surprised and at first checked by the intrusion of the forceps teeth, and then recovered to make violent and strenuous efforts to escape from the grip, and if the forceps' hold was continued it usually succeeded in this by the tearing of the fibers. One of my dogs died on the table from hemorrhage due to the tearing of the muscle in the bite of the forceps and my inability to at first catch the edge of the open wound in the bottom of a pericardium overflowing with blood, and although I did finally succeed in getting in two sutures they were placed too late.

#### A METHOD TO HOLD THE HEART DURING SUTURE.

To overcome this difficulty with the forceps I put into the heart, before incising it, two long suspension loops of silk, dipping the needle carrying them deep into the ventricular wall. These gave complete control of the organ, for they did not tear out, and even though the heart was hanging from them its function continued, and much less tumultuously than it did in the bite of the forceps; and with them the heart could be lifted quite half-way out of the pericardial incision, or it could be swung to one side or the other, or rolled over in either direction, its range of motion being limited only by the great vessels at the base.

I placed these loops side by side and about a centimeter apart, and could then incise between them, hold the wound open, by traction on the loops, to verify penetration and then, crossing the loops, could absolutely stop bleeding and steady the heart, for under this control the point of the incision seemed to be the starting point of the systolic waves.

#### DIASTOLIC SUTURE UNNECESSARY.

Now, even with the incision coapted and held relatively motionless by the crossed and taut suspension loops—so that the placing of a suture was no more difficult than in an indifferent tissue—I found it impracticable, yes, impossible, to make a diastolic thrust of the needle, to pull the suture into place in the succeeding diastole, and to tie the knots in the ones following. To do this would require a man to work with accuracy, and yet with perfectly-timed breaks in his work, in various fractions of successive seconds—for these hearts are always beating more than one hundred times to the minute. And the impossibility which I encountered has made it very difficult for me to believe that anyone, even if he has attempted it, has ever really done it. Nor can I see what is gained by it.

The heart does not bleed in diastole, it bleeds in systole, and the suture must be tied to be efficient at that time, and the way to do it is to tie quietly and firmly, during the rapid beating of the heart, and to take no account of split second diastoles, but watch the knots as one should watch the knots of the ligature in a major vessel. And the same judgment which controls the tension of the suture should control the depth to which it reaches. I can not agree, from what I have seen of the actual working of the matter, that a superficial suture will hold where a deep one will tear out. One is suturing the myocardium, not the epicardium. Of course, it is inadvisable to penetrate the endocardium, but it is, at the same time, and fortunately, a difficult thing to do. I did it once because I intended to do it, and I had to take a larger needle than I had ordinarily worked with, and definitely carry it through the heart wall and return; and from this I learned that, with the medium-sized, full-curved needle which one would commonly use, the penetration of the left ventricle is not to be feared.

On this point it only remains to be said that, in the case in which the endocardium was included in the stitch, the strand of suture stretched across the cavity of the ventricle was the occasion of the formation of a little globular clot, which was found at the autopsy to be firm and white, and surrounded by a large post-mortem clot.

Elsberg's very complete studies of the healing process showed that the muscular fibers in the bight of the suture atrophy and are replaced by fibrous tissue, and he points out that, very evidently, there would be less of this lower

grade tissue in the case of an interrupted suture: but, so far as I have been able to judge, the difference amounts to very little practically, and the saving of time in the continuous over the interrupted suture is manifest, and it is the method finally advised by Terrier and Reymond a year ago. I had thought that the lessening of the number of knots on the epicardial surface by the use of the continuous suture might be a special point in its favor, but the matter seems to be unimportant, for all knots quickly sink into the tissues, leaving a flush surface which is covered with fibrin.

#### CAUSES OF DEATH.

For my experiments I have used dogs—primarily because of the size of the heart in the larger dog—and I had the same difficulty that other experimenters have had with the animal, for there is no mediastinum, the whole thorax being lined by one continuous membrane, and as soon as this is opened both lungs collapse, so that artificial respiration by bellows is needed. There are two important points in connection with this fact: a very large serous surface is exposed to the air and to infection, and it is practically impossible to avoid leaving a certain degree of pneumothorax when the chest is closed. Collateral traumatism and infection, then, led to the early death of most of the dogs: indeed, only two lived ten days and then both died of empyema and pyopericardium. This makes it impossible for me to speak as confidently regarding the catgut suture as I should like, for *a priori* I should prefer in this place the absorbable suture, because a stitch once in is there to stay, and the opportunity of going back and removing it, if its presence is resented by the tissues, can not be looked for. Still it is to be noted that one operator, Fontan of Paris, has the distinction of having twice sutured the heart with the recovery of both patients, and Launay has successfully closed two wounds in one heart, the suture material in all three cases having been catgut, and on the other hand, Nietert of St. Louis, has also two successful heart sutures to his credit, his suture material being silk. Still, if it can be shown that the healing process takes place to a practical extent during the persistence of the catgut it will be reasonable to argue that no great objection can lie against the absorbable suture. In Elsberg's paper he asserts that reparative processes are in train in twenty-four hours, in forty-eight hours there is a dense round cell infiltration, by the fourth day spindle cells appear, by the seventh day they replace the degenerated muscle fiber, and by the tenth day the granulation tissue is becoming fibrous tissue. He reports several rabbits killed on the fourteenth day with the wound in the heart firmly healed, and in one instance a rabbit dead of sepsis had a firmly-closed heart wound on the eighth day. In two of my dogs, both dead of sepsis on the tenth day, the heart wounds were firmly closed, with no evidence of leakage or hemorrhage, although in one the infective process had attacked the epicardium and penetrated the myocardium. It does not need to be said that these dogs count for very little; but the inference is simple, from the whole evidence, that wounds of the heart muscle heal very rapidly and that the process may be practically completed quite within the life of a catgut suture. And the evidence of Fontan's two patients, one of whom was infected, and Launay's case of two wounds in one heart, is on the same side, and I shall therefore assume that catgut is, at least, a permissible suture material.

#### SUCCESS OF THE CLOSURE OF HEART WOUND.

Finally it has to be said that in my dogs these sutures,

however placed or tied, always controlled the hemorrhage and closed the opening, and that the healing processes, as they were studied, followed a course practically similar to that in Elsberg's experiments on rabbits, up to the death of my animals. They show that the repair in heart muscle is in no way different from the repair in skeletal muscles, and that it is no more interfered with by the action of the heart than are the nutritive processes of the organ.

I do not know of any of the successful cases of heart suture in man having died later, but there is reference to a case of Izzi's in which the heart was wounded but not sutured, and the man recovered, but on the twenty-eighth day, having left the hospital, he made considerable effort to lift a weight and had rupture of the cicatrix in the heart wall and sudden death. Of course, the wound in this heart had been filled by a coagulum, and in the process of healing this was organized or replaced by cicatricial tissue, and there never had been the proper coaptation of the heart muscle in the edges of the cut.

So far as the heart itself is concerned the proposition for its suture, in case of wound, is properly established: and if it were a superficial organ and easy of access, and if the path by which it is reached could easily be closed again, the whole matter would be eminently simple. The operation would be more frequently done for the occasions demanding it would more frequently arise, and the whole technic would be quickly worked out in detail. But the heart, while it is close to the surface of the body at one point, is not a superficial organ, and to reach it the bony and muscular chest wall has to be traversed—a matter of no special import—and two serous sacs have to be invaded. Herein lies the great difficulty.

#### INTERFERENCE OF THE PLEURA.

It is true that in a dissection the pericardium can usually be reached without a wound of the left pleura, but it can only be done by taking the pleura definitely into account. The anterior limits of the sac are very various and in the dissecting room it has been found to extend across behind the sternum almost to the right border of the bone. Commonly, it overlaps and lies just internal to the left border of the sternum as far down as the fourth cartilage, and from this point gradually passes downwards and outwards crossing the sternal end of the fifth cartilage and just internal to the middle at the sixth. A wound, therefore, to reach the pericardium and heart without injuring the pleura would have to be placed in the sixth interspace and close to the sternal edge, and be directed almost exactly backwards. This place is so small that practically it is never found, and it is necessary to consider that all wounds which penetrate the pericardium have traversed the pleura, and it is across the same tissue and sac that the surgeon must pass who attempts to repair the wound. There is another point to be considered here. The opening of a serous sac, either accidentally or surgically, exposes it to infection, and the serous membrane, by a power inherent in it, deals with such infection as occurs unless the latter overwhelms it. The question has been thoroughly studied by all, in its relation to the peritoneum, but I wish merely to refer to the fact that the peritoneum offers opportunities for the localization of an infection which can not otherwise be disposed of, and that intestinal rest may contribute greatly to this localization. Both the pleura and pericardium differ from the peritoneum in this respect—the surfaces of neither offer pockets or recesses in which an infection may be confined, and constant motion incident to breathing and the

heart beat, tends to disseminate pathogens and to quickly distribute them over the whole surface of the sac.

So far as the arrangement of the lymphatics of the pleura is concerned, its power of absorption should be greater than that of the peritoneum, and in certain cases of infection, as in the empyema of pneumonia, it does show considerable ability to deal with the condition; but in view of the great frequency of infection of the left pleura in connection with heart wounds, I am obliged to believe that the inability to obtain surgical rest for the tissue is a prominent factor in producing and perpetuating the condition.

In writing on wounds of the pleura and lung, Terrier and Raymond claim that infection of the pleura is not likely to occur unless there is a coincident wound of the lung. They argue that the infection probably comes from a bronchus, and base the treatment necessary for a traumatic hemothorax on the presence or absence of hemoptysis. In no one of the clinical histories of these heart wounds which I have seen is there mention of hemoptysis, but they nearly all had hemothorax, large quantities of blood being in the pleura, and a large percentage had a subsequent infection.

#### SEPSIS AND DRAINAGE.

Of the thirty-four cases, nineteen lived long enough for the development of an infection, and in ten it developed, and of these six died, showing that infection so affects prognosis in these cases that a man infected has not so much as half a chance to recover; or, to put it differently, more than half of the cases were infected, and of these more than half died. It is of particular interest to know the time of the implantation of the infection, and I have found records of nine other cases of wounds of the pericardium and heart which were not submitted to any primary operation, and of these three had local infection, and one had primary local healing but died of a peritonitis. The number of cases is very small, but so far as they go they show that about one-third of them are infected by the wounding instrument and that primary operation increases the chance of an infection to more than half; this, however, must not be taken as counting against the doing of the operation, for its object is to control conditions which lead to certain death, and even with an infection recovery is not impossible. The knowledge of the great likelihood of an infection at the time of the receipt of the wound must be made use of, and one must consider if such a wound is not to be treated as one already infected. If this is done some method of drainage will be employed, and the detail of its arrangement is complicated by this fact, that one serous sac, the pericardium, must be drained across or through another, the pleura. The advice is given, probably in view of this difficulty, that both pericardium and pleura be closed without drainage, but some operators have drained and their results merit consideration. So far as I can learn, eleven of the thirty-four cases had primary drainage arranged, four for the pleura alone, and seven for the pleura and pericardium. Of the eleven seven recovered though two had infection. Of the four who died, two died of sepsis, and two of collapse before the possibility of knowing if sepsis was to develop or not, and if we exclude these last two we have nine cases drained and seven recovering.

Now, on the other side, there were nine cases that had no primary drain, and did have infection, and of these five recovered. The number of cases is small, seven out of nine and five out of nine, but in these cases, as in many, many others, a hair, perhaps, divides the chances of suc-

cess from those of failure, and where we have only small statistics at hand, it is with those that we must work, and on them base our future actions.

In the drainage of the pericardium there is a point worth mentioning. The material should, of course, be gauze, it may be put in a small space left unclosed at the lowest point of the wound (Mignon et Sieur) and it does not need to go deeply into the sac, for with the patient supine or reclining the heart will sink in any effused fluid towards the dorsal side of the sac displacing the fluid towards the ventral side, where a drain may easily reach it; but the fluid must pass upwards from the pericardium towards the skin opening, and this is, of course, a disadvantage. For the pleura a drain may be arranged to make its exit by the same opening as that for the pericardium or, and this seems the wiser plan, it may have an independent opening near the posterior axillary line, where it will be of most service if empyema does develop, and may, in such a case, obviate the need of a secondary thoracotomy. Of course, if no sepsis supervene all drains should be very shortly removed.

#### OTHER POINTS TO CONSIDER.

In the time allotted this paper on the program of the Association it has only been possible to discuss the two technical points of suture and drainage, and the matter of the symptoms and the anatomic details of the wounds which have been put on record have, in spite of their importance, been passed by. Very briefly, the symptoms may be listed as consisting of the external wound in the precordial region, the general evidences of hemorrhage, the disturbance of the heart function sequent to the trauma and the acute anemia, and the local signs of the filling of the pericardium and, secondarily and in most cases, the pleura. As regards the wound itself, I believe, from examining the hearts which I have punctured and incised, that the endocardial wound is always smaller than the epicardial wound, excepting, I should imagine, in the bullet wound cases. This difference in the size of the wound at its two limits will explain the living of some with apparently large wounds but from which the amount of bleeding has not been commensurate with the size of the visible wound. It is necessary only to revert to the fact that the different parts of the heart behave somewhat differently when wounded. The thicker wall of the left ventricle offers a greater obstacle to hemorrhage and a better opportunity for suture than any other part; wounds of the right ventricle bleed more and are more difficult to suture, and the thin walled auricles are saved from a lethal hemorrhage, when they are wounded, by the comparatively low pressure of the blood in them, while in their loose structure a practical suture is a difficult thing.

#### CONCLUSIONS.

The operations which have been recorded mark only the beginning; the heart is now destined to be submitted to many manipulations provided they may be done without stopping its action at once. It is a very unsafe thing to prophesy, but that more will be attempted can easily be inferred, for interference with the mitral orifice has already been suggested, and the immediate neighborhood of the heart has been invaded and a sacculated aneurysm of the aorta has been tied off, the success of this well-executed maneuver being prevented only by the failure of the atheromatous vessel walls to heal. Possibly, the next step may be delayed as long as the application to the heart of common surgical methods was delayed after Desault had taught us to

open the pericardium. Perhaps it may come soon. It is not impossible that a new surgical technic may have to be created, but it is most probable that the next step will be based on the new application of the very old matters of the suture and drainage.

## MEMORANDUM OF EXPERIMENTS.

CASE 1.—Mongrel Newfoundland dog, ether, thorax opened to left of the sternum by turning up a flap of bone, muscle and skin. Triangularis sterni was carefully incised, but the pleura

air and ether vapor. Sternum exposed and then split by a costatome. In doing this the left lung was wounded, but the right was not and its inflation proved sufficient for respiratory purposes. Thorax widely opened, pericardium picked up and opened and then, by seizing the edges of the opening with hemostats and lifting, the heart was brought up into the opening in the chest wall. The heart's action was strong and regular. Heart wall caught with toothed forceps; systole postponed, and then rapid and tumultuous heart action, tugging forcibly on the forceps. Punctured wound into left ventricle,

## CASES OF SUTURES OF WOUNDS OF THE HEART.\*

| Operator and Year.                | Location of External Wound.   | Chamber Wounded and Size of Wound.   | Time of Operation After Injury. | Anesthetic. | Results and Remarks.  |
|-----------------------------------|---|--|---------------------------------|-------------|---|
| 1. Farina. 1896...                | Just above the margin of the left sixth rib, near the sternum.              | R. V.; $\frac{1}{4}$ inch; 3 stitches.                                     | .....                           | .....       | Death on sixth day, from broncho-pneumonia.   |
| 2. Cappelen. 1896...              | Fourth left intercostal space in mid-axillary line.                         | L. V.; $\frac{1}{2}$ inch; 3 stitches.                                     | 1 hour.                         | .....       | Death after several days; pericarditis; branch coronary artery cut. Recovery; empyema.          |
| 3. Rehn. 1896...                  | Fourth left intercostal space near sternum.                                 | R. V.; 3 stitches.   | Following evening.              | .....       | Recovery.   |
| 4. Parozzani. 1897.               | Seventh left intercostal space in mid-axillary line.                        | L. V.; $\frac{1}{4}$ inch.   | 5 hours.                        | None.       | Recovery.   |
| 5. Parozzani. ....                | Third left intercostal space.   | L. V.; $\frac{3}{5}$ inch.   | $\frac{1}{2}$ hour.             | None.       | Death on second day from anemia (?). Interventricular septum had been cut. Recovery; empyema.   |
| 6. Fummi. 1898...                 | Under left nipple.  | Apex; cavity not opened; 1 stitch.   | Several hours.                  | .....       | Recovery; empyema.  |
| 7. Ninni. 1898...                 | Fifth left intercostal space.   | L. V.; 3 stitches.   | Quickly.                        | None.       | Death on table.   |
| 8. Parlavacchio. 1898             | Fifth left intercostal space.   | L. V.; $1\frac{1}{2}$ inch; apex.  | 8 hours.                        | Chloroform. | Recovery.   |
| 9. Giordano. 1898                 | Second left intercostal space.  | L. A.; $\frac{4}{5}$ inch; 4 stitches.                                     | $\frac{1}{2}$ hour.             | None.       | Death on nineteenth day from empyema; abscesses of right lung.                                  |
| 10. Nicolai. 1899...              | Fourth left intercostal space, midway between margin of sternum and nipple. | R. V.; 3 stitches.   | $1\frac{1}{2}$ hours.           | Yes.        | Death after twelve hours.   |
| 11. Tuzzi. ....                   | Fourth left intercostal space.  | Two wounds; non-penetrating.   | .....                           | None.       | Death on twenty-second day from empyema; pericarditis.  |
| 12. Longo. ....                   | Fifth left intercostal space; 2.5 inch internal to nipple.                  | L. V.; 3 stitches.   | At once.                        | None.       | Death in fifteen minutes.   |
| 13. Ramoni. ....                  | At third left cartilage; $\frac{4}{5}$ inch from sternum.                   | R. V.; 2 wounds; 1 non-penetrating; 4 stitches.                            | .....                           | None.       | Recovery.   |
| 14. Marion. 1899...               | Shot through breast.  | R. V.; catgut sutures.   | .....                           | .....       | Death.  |
| 15. Rosa. 1899...                 | Fifth intercostal space.  | L. V.; $\frac{3}{5}$ inch; not certain it penetrated ventricle.            | .....                           | None.       | Recovery.   |
| 16. Horodyski. 1899               | .....   | R. V.; $1\frac{1}{2}$ cm. long.  | .....                           | .....       | Death.  |
| 17. Maliszewski. 1899             | .....   | .....  | .....                           | .....       | Death.  |
| 18. Maliszewski. 1899             | .....   | .....  | .....                           | .....       | Death.  |
| 19. Bufnoir. 1899...              | Sixth left intercostal space.   | R. V.; gun-shot; 22-calibre.   | .....                           | .....       | Death; necropsy showed perforation of ventricle and the anterior opening only had been sutured. |
| 20. Pagenstecher. 1899            | Fourth left intercostal space beneath the nipple.                           | L. V.; near apex; 2 stitches.  | 16 hours.                       | None.       | Recovery.   |
| 21. Nanu. 1900...                 | Third intercostal space, 4 cm. from edge of sternum.                        | R. V.; 2 cm. long; 2 interrupted sutures.                                  | .....                           | .....       | Death on fifth day from infection of pericardium and pleura.                                    |
| 22. Maselli. 1900...              | Below and internal to left nipple, cutting sixth rib.                       | L. V.; near apex; 2 stitches.  | $1\frac{1}{2}$ hours.           | .....       | Death in twelve hours.  |
| 23. Fontan. 1900...               | Six wounds with scissors between third and seventh ribs in cardiac region.  | L. V.; 12 mm. long; continuous catgut sutures; 3 stitches.                 | 6 hours.                        | Chloroform. | Recovery.   |
| 24. Nietert. 1901...              | .....   | R. V. penetrated; 3 silk sutures.  | .....                           | .....       | Death after thirty-six hours.   |
| 25. Vaughan. 1901...              | Fifth left costal cartilage divided.  | L. V.; $2\frac{1}{2}$ cm. long; continuous silk sutures; 7 stitches.       | $\frac{3}{4}$ hour.             | Ether.      | Death on table from hemorrhage about completion of operation.                                   |
| 26. Nietert. 1901...              | Left of sternum.  | L. V.; not sure cavity was penetrated; 2 sutures.                          | .....                           | .....       | Recovery.   |
| 27. Ninni. 1901                   | Left of sternum.  | R. A.  | .....                           | .....       | Death in four days; sepsis.   |
| 28. Mignon et Sieur. 1901.        | .....   | R. V.  | .....                           | .....       | Death.  |
| 29. Fontan. 1901...               | .....   | L. V.; catgut sutures.   | .....                           | .....       | Recovered; had empyema.   |
| 30. Brenner. <sup>1</sup> 1901... | Left of sternum, near sixth cartilage.                                      | R. V.; 7 cm.   | Following day.                  | Yes.        | Death on table; degenerate heart muscle.  |
| 31. Watten. <sup>2</sup> 1901...  | Fourth right intercostal space.   | R. V.; 3.5 to 4 cm.  | .....                           | .....       | Recovery; right pleura wounded; pneumothorax.   |
| 32. Lastaria. 1901...             | .....   | L. V.  | .....                           | .....       | Died soon.  |
| 33. Launay. <sup>3</sup> 1902...  | .....   | L. V.; ant. and post. walls; pistol shot; catgut sut. in each.             | .....                           | .....       | Recovery; no complications.   |
| 34. Nietert. <sup>4</sup> 1902... | Left sixth interspace, to right of papillary line.                          | L. V.; far back, 2 cm.; penetration uncertain; 2 interrupted silk sutures. | $14\frac{1}{2}$ hours.          | .....       | Recovery; purulo-sanguinolent effusion and thoracotomy.   |

\* Cases 1 to 26 inclusive from table of Geo. T. Vaughan, M.D., Medical News, Dec. 7, 1901.

1. Wiener Klin. Woch., 1901, No. 11.

2. Deutsche Med. Woch., 1901, No. 37.

3. La Presse Medicale, March 29, 1902.

4. Phil. Med. Jour., May 3, 1902.

was opened and both lungs immediately collapsed. Pericardium was quickly opened and heart was massaged, as its action failed, to keep it going until the trachea could be opened and the bellows apparatus attached. Manipulations were not quick enough and the dog died on the table. A dissection showed that there was not one pleural sac for both sides of the chest, and that the lungs surrounded the heart much more completely than they do in man.

CASE 2.—Mongrel Newfoundland, hypodermic of morphin 0.1; ether. Tube in trachea and connection made with a bellows apparatus which permitted the use of air alone, or of

parallel with the superficial fibers. Spurt of blood, dark in color (because of collapse of one lung), systolic in time. The action of the heart was so rapid that it was impossible to estimate the amount of diastolic hemorrhage. Two interrupted emulized catgut sutures, passed deeply but not intended to penetrate the endocardium. Hemorrhage controlled absolutely. Pericardium sponged out and closed by a continuous catgut suture. Chest wall sutured, the sutures drawing together the sides of the split sternum, and dog left with a certain amount of pneumothorax, the right lung being easily inflated, but the left being wholly collapsed and at the back of the chest. Deep

and half deep sutures in the subcutaneous tissues and a subcuticular stitch for the skin. Gauze and collodion over suture line and gauze pads and a body bandage over all. The tube was taken out of the trachea—each cut cartilaginous ring sutured and also the membrane between. The separated muscles put in place, and deep, half deep, and subcuticular sutures as in the chest wound, and then same kind of dressing applied. As soon as the bellows apparatus and the tracheal tube were removed active respiration began. After five minutes it was 17 to the minute and fifteen minutes later it was 16 to the minute. The character of the respiration was good. Twenty-four hours later the dog was in a bad state—he would not stand, nor eat nor drink. Respiration was deep and labored. Dog found dead on the morning of the second day. Heart only examined. The two sutures were easily seen.

*Microscopic examination of the wound area.* Exudate on pericardium is comparatively thin and consists chiefly of coagulated fibrin in which are polymorphonuclear leucocytes and a large number of small round cells. The pericardium had lost its typical glistening appearance. It is taking part in the inflammatory process on its surface. Considerable amount of altered blood pigment is found in the pericardial exudate. Sutures surrounded by a mass of leucocytes can be seen in this section and the incision extends direct from the pericardium to the endocardium. It is characterized by extensive extravasations of blood, coagulated fibrin, and platelets in which are numerous polymorphonuclear leucocytes. The heart muscle cells on either side of the incision are undergoing either hyalin degeneration or coagulation necrosis. Karyolysis is marked in these cells. In the intermuscular septa between the different fasciculi of muscle fibers are found extensive accumulations of leucocytes, many of which contain pigment granules derived from the blood. No definite evidence is obtained from the section that the repair is advanced to an extent marked by the new formation of blood vessels. The endocardium is somewhat thickened and is covered with an exudate composed of fibrin, leucocytes, red blood corpuscles and blood platelets. The wound in the endocardium is not closed.

CASE 3.—Big short-haired mongrel, hypodermic morphin 0.1; ether. Tube in trachea. Sternum split with a strong knife and lungs not wounded. Bellows at work and thorax opened widely. Pericardium split open and heart lifted to surface as in Case 2. Punctured wound as before, heart steadied by toothed forceps grasping fibers. Strong systolic jets of blood. One suture, catgut, controlled it, though it was not passed deeply. A second suture, more superficial, was put in. The pericardium was cleared of blood and sutured and all the other tissues closed as in Case 2. Chromicized catgut, thick and strong, was used for the sternum. As the final stitches which closed the subcutaneous tissues over the sternum were placed and tied the lungs were fully inflated to expel all the air possible from the thorax. The dog came out of the ether quickly and whined and struggled. Pulse 156, respiration 18. Two days later the dog was up and about and ate and drank and was friendly. At the end of the week the wound was open somewhat and the dog was weak and sick. He was found dead on the tenth day.

*Postmortem.*—Tracheal wound healed throughout and without suppuration. Sternal wound healed in part per primam and in part per secundum except that from the upper and lower ends were open sinuses leading in, and from them came seropurulent fluid. The lower sinus communicated by a tortuous narrow (2 mm.) path with the pleural cavities. Muscles and cellular tissues of the thoracic wall show intense inflammatory reaction. Both sides of chest cavity full of serosanguineous exudate, with purulent flocculi. Entire pleura covered with a fibrino-purulent exudate and lungs adherent at places by fresh adhesions. Lungs atelectatic, free borders and surfaces shriveled and puckered. Cut surface of lung shows congestion but is otherwise normal. Pericardium adherent to inner surface of sternum, the incision in it opened and cavity communicating directly with the incision. Pericardial cavity contains small quantity purulent exudate and same is on epicardium and pericardium and an adhesion between these exists along the line of incision in the myocardium. Incision may

not have opened ventricular cavity. Diaphragm and liver pushed down by the amount of pleural exudate. No changes in abdominal viscera.

*Note.*—In the laboratory where this dog was operated upon other dogs had been used for experimental abdominal work, and some bone work had also been done. This dog had had an intestinal suture a month before the heart operation. The intestinal and other abdominal work had been followed by clean aseptic healing. The incisions for the bone filling which were over the trochanters, had in two instances been torn open by the dogs. The heart operation was done with the utmost care to secure aseptic conditions, and in spite of it a massive infection occurred.

*Microscopic examination of wound area.*—The epicardium over the incision in the heart muscle is covered by a thick partially-organized exudate which consists chiefly of coagulated fibrin with numerous polymorphonuclear leucocytes embedded in the meshwork formed by its filaments. A considerable number of new-formed blood vessels and fibroblasts can be seen making their way from the pericardium into the mass of the exudate. This also contains numerous fat globules. The catgut sutures can be distinctly seen in the myocardium and are surrounded by an intense zone of reaction, the chief part of which consists of polymorphonuclear leucocytes and numerous round cells. Evidence of the formation of a few new blood vessels seen at the periphery of the zone. Specimen not stained for micro-organisms, but the tissues at these points had the appearance of being infected and look like early abscess formation. For a considerable distance beneath the epicardium over the whole area covered by the exudate there is a marked degeneration of the heart muscle cells. They stain poorly, the outlines are not clearly marked, the nuclei show bizarre arrangement of the chromatin and occasional instances of karyolysis. No evidence of fibrillation can be seen in the degenerated cells. In the interspaces between are numerous polymorphonuclear leucocytes and small round cells. Along the line of incision in the heart muscle there is some evidence of healing, the extravasated blood is mostly absorbed and the adjacent walls of the wound bound together by coagulated fibrin. Here and there are occasional spots suggestive of the formation of new blood vessels. Either the incision does not extend to the endocardium or the section of the heart muscle has taken an oblique plane so that in this section at least the endocardium remains unaltered and intact.

CASE 4.—Big shepherd dog, hypodermic of morphin 0.1; ether. Tracheal tube and bellows. Thorax and pericardium opened as in Case 3 and without wounding lungs. Transverse punctured wound in left ventricle, close to apex, violent systolic hemorrhage, the heart beating very rapidly. Muscle in bite of forceps tore out and heart escaped, beating rapidly and bleeding profusely. Finger in apex partly controlled bleeding, but position difficult to maintain because of the action of the heart and a little force tore the opening, making it a 2 cm. rent, and finger passed into ventricle. Dog began to make respiratory efforts in spite of bellows. Edge of wound finally caught with forceps and two sutures hurriedly passed and apparently closed opening and checked bleeding. Heart action getting weaker, but suture of pericardium begun. Heart stopped before completion of pericardial suture.

*Heart removed.*—wound found to be larger than had been thought, and only half of it sutured. Pericardium and thorax full of blood clots. Heart muscle had been torn by the forceps and the finger, and apparently was more than ordinarily friable.

CASE 5.—Big mongrel Newfoundland, hypodermic of morphin 0.1; ether. Tube in trachea and bellows attached. Usual technic to expose heart. Two loops of silk, medium size, each loop about 15 cm. long put transversely into wall of left ventricle 2.5-3 cm. from apex, and about 1.5 cm. apart. The needle carrying the upper loop punctured the coronary vein and it was tied by a catgut suture carried around it by a small needle. The heart could be easily lifted by the loops and swung to right or left, or rolled over in either direction and the complete control was very satisfactory. A transverse puncture was made between the loops and the wound held open by them. The jet of blood, systolic, was very forcible. The

loops were then crossed and the opening closed. The taut loops now steadied the immediate field of operation and made the placing and tying of the sutures a simple matter. Three interrupted catgut sutures were put in, penetrating only 2-4 mm. into the myocardium, and controlled the hemorrhage. Silk loops were removed and there was no particular bleeding from their track.

*Early in the operation* the left internal mammary had been wounded near the upper part of the incision. As more dissection would have been needed to tie it pressure was tried and seemed to be enough. Bleeding recurred as the chest was being closed, but pressure again seemed efficient. Usual method of closing all cut tissues. In spite of efforts to avoid it considerable air was apparently left in the chest. Usual dressings. Half hour after chest was closed, respiration 26, somewhat labored. Death in less than twenty-four hours.

*Postmortem.*—Dressings blood-stained. Superficial and deep tissues on both sides of wound infiltrated with blood and a large clot under the right pectoral. The catgut sutures around the sternum had yielded. Pleural cavities full of whipped blood, and large clot in left side—lungs deeply congested, with fibrinous exudate at places on pleura. No healing in pericardial incision, pericardial sac filled with fluid, epicardium injected, but smooth and with no adhesions. Left ventricle in systole, right in diastole. Incision in wall 2 cm. long, closed by three sutures. Slight fibrinous exudate over wound. Internally, wound 6 mm. long, and covered by small fibrinous flake or globular thrombus.

**CASE 6.**—Boston terrier. Morphine 0.1, ether. Tube in trachea and bellows attached. Usual method of access to the heart; two silk loops in the left ventricle, transversely, near apex. Incision, transverse to superficial fibers, 1 cm. long, between the loops. Systolic spurts of blood, and hemostat introduced into the heart to verify penetration. Three catgut sutures—the middle one superficial, the two outer ones deeply placed to penetrate endocardium—the sutures turned in the edges of the incision somewhat. Usual method of closing incised tissues, except that the halves of the sternum were fastened with heavy black silk. Fifteen minutes after the removal of the tracheal tube, respiration 66 per minute, easily, as a dog breathes when running a little. Death in about 48 hours.

*Postmortem.*—Extensive submuscular emphysema, and a hemorrhage under the left pectoralis major. Silk sutures on sternum held perfectly. Pneumothorax, with emphysema of the connective tissue in the mediastinum. The air had followed along all structures that traversed the chest, especially the phrenic nerve, the lymph glands and the larger vessels and it worked along the sheath of the vena transversa from the first rib outward into the left axilla with the subclavian vein and so produced the submuscular emphysema, and on the right side, too, it had followed the subclavian vein through the costocoracoid membrane. The left pleura contains about 10 c.c. of bloody serum. Pleural surface covered with fibrinous exudate. Pericardial wound healing. Sac contains about 10 c.c. bloody serum. Pericardium slightly adherent to epicardium by thick fibrino-serous exudate and when the two membranes are pulled apart the "battered bread" appearance of the surface is presented. Heart, left ventricle in systole, right in diastole. Wound in myocardium extends 1 cm. upwards and medianwards from apex, through septum into left ventricle. Closed by three interrupted catgut sutures. Wound covered by fibrinous exudate. Endocardium smooth except just about wound where there is red subserous hemorrhage. A white thrombus hangs from the strand of catgut in the ventricle, with postmortem clot about it.

*Note.*—The emphysema in this case had an interior source and can only be accounted for by some wound of the lung which could not be located. Perhaps there was a rupture or a wound when the lungs were distended to fill the chest at the time of the last suture.

**CASE 7.**—Mongrel Newfoundland, morphine 0.1, ether. Tracheal tube and bellows. Usual approach to heart. Two loops, longitudinal, in left ventricle. A long incision, 2.5 cm. between the loops, opening the ventricle widely. Furious systolic hemorrhage. Loops crossed and opening closed and hem-

orrhage stopped. Rapid, continuous catgut suture from top to bottom of wound and return. One knot. Usual method of closing wounds. Very little air left in thorax. Six days later, dog alive. Later failure of strength and death on the tenth day.

*Postmortem.*—Body emaciated. Tracheal incision partly healed. Wound in thorax healed except at lower part, where it is somewhat open with sero-sanguineous discharge. Thorax deformed and looks like the pigeon breast of rachitic children. Pericardium adherent to chest wall; two halves of sternum not united but held by the sutures. Pleura everywhere injected and covered by fibrino-purulent exudate. Some adhesions. Some blood-stained fluid in right pleura and more in left. Lungs congested, but no consolidation. Pericardium thickened and injected, and incision only partially healed. Contains a little sero-purulent exudate. Numerous adhesions between epicardium and pericardium, especially on the dorsal aspect, and when separated gave the "battered bread" appearance. Incision in myocardium covered by fibrinous exudate, and purulent necrotic mass underneath it. Endocardium not examined. Peritoneum injected and with occasional areas of fibrinous exudate. In small intestine, about 30 cm. from the ileo-colic junction, an area of gangrene, 4 cm. long on the lateral aspect of the gut, and in the middle of this a perforation. In the gut mucosa was discolored, and covered by a soft brownish necrotic mass. Nothing else of moment in the abdomen.

*Microscopic examination of wound area.*—The exudate of the pericardium is even thicker than that of dog No. 2. It has the same constituents except that it is richer in fibrin and platelets and in R.B.C. Exquisite examples of new blood vessels can be followed from the pericardium into the exudate, but these vessels do not appear to be quite as old as those in dog No. 3. The reaction in the endocardium is extensive but does not penetrate deeply into the heart muscle, as in the case of the first section described. The heart muscle cells show just under the pericardium some evidences of degeneration, namely, in the pallor of the sarcoplasm marked karyolysis and in vacuolization. The line of necrosis which corresponds to the cheesy area described in the gross specimen. Sutures surrounded by a mass of polymorphonuclear leucocytes and small round cells showing all the stages of nuclear fragmentation or karyorrhexis. The area around the stitches has almost reached the stage of abscess formation. In many places the degeneration of the heart muscle has extended so far that the karyolysis is complete in the muscle cells and they appear as a pale pink staining mass of cytoplasm which do not even show the characteristic striations of the heart muscle cells. Neither the large nor the small disc of MacCallum are visible, nor are Krause's membranes made out. Under the immersion lens even with hematoxylin stain small masses of bacilli and cocci are visible. These are gathered in the spaces between the dead muscle cells and are also found along the line of incision and in the exudate on the surface as well as about the stitches.

**CASE 8.**—Big water spaniel, morphine 0.1, ether. The incision in the sternum, made with a costatome, failed to hold to the middle line and the lung was nipped. In opening the pericardium the coronary artery was cut and bled freely, but was easily ligated. In placing the silk suspension loop the rapid motions of the heart prevented accuracy, and the artery was wounded again, and again ligated. The left ventricle was opened by a punctured wound close to the apex, and then a closed hemostat was put in and opened so as to make the endocardial side of the wound the larger. A continuous very superficial suture controlled the hemorrhage. About 5 c.c. normal salt solution (NaCl 6, KCl 2.5, Ca Cl 0.5, Aqua 1000) with some carmin in it was put into the pericardium and the incision sutured. About 500 c.c. of the same salt solution was poured into the pleura to displace any residual air. The punctured point on the lung was ligated and cut off. The usual method of closing the thorax. The dog lived about 48 hours, and the autopsy appearances were like those of Case 6. The use of the salt solution made no particular difference in the result.

CASE 9.—Big mongrel, morphin 0.1, ether. Tube in trachea. Usual approach to heart. Lung nipped by costatome. Heart punctured with needle—as point entered myocardium a postponed systole, which, when it came, was violent and followed by rapid action gradually slowing to the usual rhythm. The needle was withdrawn after the postponement. This was done to see if the acts of placing a suture could have been done in successive diastoles, and the experiment was repeated, but no diastole long enough for a definite act, like pulling through a suture or tying a knot, occurred. The bleeding from the needle wounds stopped spontaneously and quickly. The right coronary artery was cut and bled by spurts during systole, and was then tied. Transverse incision, 1.1-5 cm. near apex. Two interrupted stitches stopped all hemorrhage. Two c.c. salt solution with carmin in pericardium just before last suture. Pericardium and chest closed in the usual way. Heart beating rapidly and not very forcibly. Dog died in about 48 hours.

*Autopsy* showed conditions similar to those in Case 6.

CASE 10.—Mongrel fox terrier, morphin 0.1, ether. Tube in trachea. Heart approached in usual way with no collateral injury. No incision in heart. Usual closure of pericardium and thorax. At this point the heart stopped and the chest was reopened and the heart massaged, exciting only feeble fibrillary arrhythmical contractions. Strychnin in the femoral vein and in the heart muscle produced no effect.

Death was ascribed to overdose of ether, as the apparatus was set for the administration of ether with the air.

CASE 11.—Small Mongrel. Same operation as Case 10. Again symptoms of heart failure and some delay in the resumption of active respiration, but 4 mgr. of strychnia stimulated both functions. This dog lived two weeks and then had an open wound over the sternum with the loose ends of the costal cartilages projecting from the surface of the wound. He was in good condition and begged for a dead rabbit which was in the laboratory. He was given morphin 0.1 and ether. Tube in trachea through new incision. An attempt to dissect into the pericardium past the lungs, which were assumed to be adherent to the deep side of the cicatrix, failed, and the pleura was again opened. Pericardium was adherent to the cicatrix, was opened, the line of suture had healed perfectly and the visceral side was smooth. Very little fluid in endocardium. No adhesions to heart. As it was out of the question to again close the thorax the dog was permitted to die.

CASE 12.—Small mongrel, morphin 0.1, ether. Tube in trachea. Usual approach to heart. Suspension loops. Punctured wound, longitudinal 1 to 1.5 cm. Three moderately deep interrupted sutures. Usual closure of pericardium. A change in the method of closing the thorax was a failure and the dog died in a few hours.

Two Belgian hares and two rabbits were also used, because of their having two pleura separated by a mediastinum, but we failed to be able to open the pericardium without opening the left and sometimes also the right pleura in this quartet and there was no time for further trials.

#### CLOSING REMARKS.

The early death of these dogs was a disappointment for I had especially desired to see if the cicatrix in the heart muscle would stretch with the lapse of time, or would yield under the strain of rapid and forcible action. As it was, in no instance was death due to the rupture of the wound or to hemorrhage from the failure of a stitch, and in the two dogs which lived long enough to permit a satisfactory observation the wound in the heart was rapidly healing. The supervention of sepsis and its usually rapidly fatal effect was apparently unavoidable, for all the technic of the operating room, even to having the preparation of the dog and the instruments and the operating table in the charge of a male trained nurse, was practiced. As I have said in the body of the paper, the pleura lacks the mechanical arrangements which favor the localization of infection in the peritoneum, and an originally minor infection has opportunity to become a general and extensive

one. Drainage of the pericardium and pleura in the dog is not to be thought of, because the pericardium is in the middle of the one pleural sac, and could only be drained through it; and drainage of the pleura would inevitably result in the collapse of both lungs. Therefore, the dogs were permitted to die and no effort was made to help them out of their septic state.

## STATE MEDICINE, PAST, PRESENT AND FUTURE.

ORATION ON STATE MEDICINE DELIVERED BEFORE THE FIFTY-THIRD ANNUAL MEETING OF THE AMERICAN MEDICAL ASSOCIATION, AT SARATOGA SPRINGS, N. Y., JUNE 10-13, 1902.

J. M. EMMERT, M.D.

ATLANTIC, IOWA.

State Medicine had its origin with Moses, the great legislator. The bloodthirsty Egyptians of the dark ages, who in superstitious ignorance destroyed the lives of those among them who differed from their belief or creed, left nothing which the human race could follow for the preservation of health and life. Thirty odd centuries ago, the great law-giver, Moses, laid down sanitary rules, regulations and exercises which are followed at the present day by all civilized and semi-civilized nations.

#### THE SANITARY CODE OF MOSES.

Some 1300 years before the Christian era, the code contained in the Mosaic Exodus laid down restrictions on every possible act that mankind may perform to impair or impede existence. Such as they are, it is hardly possible to improve upon them at this enlightened day. Moses instructed his people that those sanitary commands were inspired by a Supreme Being; that the only health officer in existence was the Almighty, who could watch over their trespasses against the law. No matter where they might be, or what they might do, the Supreme Overseer would bring them to justice for the violation of the code of health.

It was handed down to the Israelites in an oral way for about one thousand years, when it became corrupt and neglected, like other laws of long standing when there is no one to enforce them.

About six centuries before the Christian era, the great Sanhedrin was formed; it consisted of seventy-two men, who compiled the oral law to a written law, adding to it, besides the moral, every possible sanitary regulation

that may benefit human health and life. This tribunal enacted laws to improve every possible means of securing healthy food, clothing and shelter, and established minor judiciary courts in every possible community, and gave these courts the right to bring before themselves anyone who violated the sanitary measures. The laws of the Sanhedrin were enforced and well kept for hundreds of years, during the time that Judea could establish and enforce its own laws, but when it fell under the sovereignty of the Romans, they were unable to enforce the laws with Roman influence: consequently, they were kept only by the pious Jews.

#### THE JUSTINIAN LAW.

The infidels could not be compelled to keep the commands under the Roman law. Hence the pious Jews of the sixth century appealed to the Roman Emperor Justinian, under whose reign a code was compiled by sixteen eminent jurists, establishing laws for all Roman states, and quoting decisions mostly from the Jewish Talmud, including many moral and sanitary measures, which is now termed the Justinian Law. Besides adopting many of the Talmudic laws, which did not differ from the Mosaic, they added many practical and sanitary regulations. It is to the Justinian Law that our present civilization is indebted for the abolishment of polygamy. It is to the laws of Justinian that we are indebted for the prohibition of the marriage of consanguinity. The combination of the Mosaic, Talmudic and Justinian laws forms a fair code for the preservation of human life. The Bible itself is one of the very best text-books on hygiene that has ever been written. He who strictly follows its teachings will be a perfect sanitarian. "We must learn," says a distinguished writer, "to regard physical as well as moral sins as greatly displeasing in the sight of God."

#### FEATURES OF THE MOSAIC LAW.

Jewish hygiene and diet are well known for their regulation to healthy food, for the Jews are restricted to certain fish of the waters and certain beasts of the field. It is from the Mosaic Law that we have learned to legislate against unwholesome food, especially of animal food. Every one of us knows with what care the Jews kill their cattle and their fowls, and with what care the autopsies are made on the animals before they are declared fit for use.

The sanitary laws of Moses provided for the segregation of lepers and the fumigation and destruction of infected clothing. These had great influence on Christian nations when contagion was recognized in epidemics, and probably most of them were, from the standpoint of to-day, either directly or indirectly infectious, and a grand advance in preservative methods became possible. All European nations enforced laws for limiting the spread of leprosy, and these, which have been handed down from ancient times, had merely to be modified in their application in order to exercise a controlling influence on the spread of fulminant febrile diseases.

#### PESTILENCE AND SUPERSTITION.

Before and after the beginning of the Christian era, plagues, pestilences and famines were classed together as of divine origin. The Greeks and Romans, from the evidences of their authors, resorted to forms and ceremonies to avert epidemics. Statues were erected to Æsculapius and Apollo; Sibylline books were consulted, nails were driven into the walls of the Temple of Jupiter Capitolinus, and the Lectisterne ceremonies were among the remedies applied to epidemics before the time

of Christ. Later, festivals, mournings, and founding of religious structures were resorted to in order to appease the divine anger, to which the epidemics were attributed. For hundreds of years, thousands and thousands of human lives were sacrificed from various causes and infectious epidemics, of which we now seldom hear. The so-called sweating plague of the latter part of the fifteenth and the forepart of the sixteenth centuries, has not been heard of since 1551. Black death and epidemics of cholera with its ravages as late as 1848 and 1849, and the last of the tropical countries, yellow fever, to say nothing about the various other zymotic epidemics and infectious diseases, such as typhus, diphtheria, scarlatina, etc., have become a rarity among civilized nations. Livy tells us that during epidemics the Roman citizens shut themselves up in their houses and paid attention to nothing except how to preserve themselves from the pestilence. Boccaccio refers in his tales to the attempts made by Florence to preserve her citizens from the plague which overspread Europe in 1346 by denying access to all sick persons.

#### THE FIRST QUARANTINE.

The first arrangements for the isolation of the sick and quarantine establishment against infectious diseases reach back to the tenth century. Charles IV, in 1347, made a statute for German states, including certain measures for the isolation of the sick and quarantine establishment against certain diseases.

In 1348, a "Board of Supervision," a sort of council of hygiene which in the end served as a model for all Italy, was first established in Venice. At Majorca, in 1374, a committee of officials presided over by a physician, Lucien Colomines, was appointed with extensive powers, to whom the local magistrates at the outbreak of the plagues were directed to report.

This committee was also allowed a hospital, and it was directed that no ship should discharge passengers nor unload freight without their knowledge, nor should any port sales be held without preceding notice to the sanitary council. Suspected ships were required to keep quarantine for forty days, hence the name quarantine.

In 1348, the year of the extension of the black death, it was noted by many observers, and especially recorded by Gabriel de Mussis, who fled from the Crimea to Plaisance in France, that ships and passengers from the East conveyed the disease. That same year Venice, then the center of maritime commerce, appointed three proveditors of health to take measures for the prevention of the plague. Count Barnabo, in 1374, issued a decree at Reggio, in Italy, that any person attacked by the disease should instantly leave the city, fortress or castle for tents in the open country, until recovered or dead; that persons attending the sick should not consort with others until after the lapse of ten days; that the priests should examine and notify the infected sick to the inquisitors, and that all goods and property of persons infected, or who conveyed infection, should be confiscated to the use of the church, and none but those appointed should, under penalty of death and confiscation, attend upon the plague-stricken.

In 1382, Chalin de Vinario demonstrated that contagion was the cause of the spread of the plague. The following year Count Barnabo prohibited entrance of persons from infected localities under penalty of death; and his successor, Viscount John, in 1399, ordered the city gates to be guarded against admission of strangers from infected places, infected houses to be fumigated and thoroughly ventilated for a long period, clothes and

bedding to be washed and dried in the open air. bedsteads to be exposed for days in the open air, and all refuse matter and rubbish to be burnt.

In 1400 the Berlin butchers were compelled under the law to take the following oath: "I will sell no suckling sow, no consumptive or one-eyed cattle, and no cattle purchased from poor people out of the hospitals."

#### EXTENSION OF QUARANTINE.

During the fifteenth century, severe measures were employed in times of pestilence. Boards of health were frequently convoked and strict health ordinances issued. "It is forbidden to attend foreign markets and fairs. Whosoever, however, did attend fairs must undergo quarantine, the guard of the gates were strengthened, suspected persons were not admitted and strangers must bring evidence that they had not sojourned in places afflicted by the pestilence. 'Blotterhauser' were built, the attendants were forcibly pressed into service as nurses, the sick were shut up in their houses, suitable directions as to mode of life, even as to purification of the washings of the body and bed, on interment, etc., were published. The council sought to suppress the use of secret remedies, sorcery and necromancy: amulets were interdicted and burned."

The first quarantine port was established at Marseilles in 1526, and during this century the system of quarantine extended to most of the maritime cities of the Mediterranean, and many inland cities adopted similar precautions.

In 1846 the work on contagions and contagious diseases, by Fracastor of Venice, declaring contagion to be exhaled by the body, infecting those at hand directly through the air, and those at a distance through the medium of fomites, induced greater measures of exclusion. By degrees, the practice of quarantine extended over the whole civilized world, and the penalty measures were increased in severity. Torture and death awaited alike those who remained in the city, when ordered out, and those who entered when forbidden access. In the sixteenth century, not only were ships with their passengers and cargo detained in prolonged quarantine, but towns also were surrounded by sanitary cordons and completely blockaded for long periods, and even individual houses in the towns were closed against exit and entrance. Food and necessities were obtained with difficulty and by the most circuitous methods of exchange, whilst politics, commerce, and social intercourse stagnated.

#### QUARANTINE IN THE UNITED STATES.

The first quarantine act adopted in the United States under the colonial system was passed by the General Assembly of Pennsylvania in 1700, and was entitled, "An act to prevent sick vessels coming into this Government." It imposed a penalty of one hundred pounds on any infected vessel which landed in the province. Other quarantine acts of greater or less severity were adopted by Massachusetts in 1701, Virginia in 1722, Delaware in 1726, North Carolina in 1775, New York in 1758, Maryland in 1760, etc. The first general quarantine act adopted by Congress was passed Feb. 23, 1799, and was designed to be supplementary to the various state acts. It was entitled, "An act respecting quarantine and health laws."

During the eighteenth century maritime quarantine and lazarets extended, especially on the Mediterranean coast, and increased in importance when inland pandemics subsided in severity. The quarantine services under boards of health, with their stations, lazarets, de-

tentions, disinfections, numerous attendants and complicated ordinances, became large organizations. Europe was less frequently invaded by plague, against which maritime quarantine was almost entirely directed; therefore the lazarets were neglected, and the administration became lax. At the end of the century John Howard made strong protests and, in the beginning of the nineteenth century, cholera and yellow fever made their advent. This revived the interest in the prevention of pandemics, and shook the confidence placed in quarantine, as it was practiced at that time.

#### INTERNATIONAL SANITARY CONFERENCES.

The severe measures designed for plague in the seventeenth and eighteenth centuries were adopted for cholera and yellow fever in the nineteenth century, and they were embodied with modifications in a lengthy convention, accompanied by an elaborate International Sanitary Code. At the International Sanitary Conference held in Paris in 1851, and represented by twelve European powers. This convention did much to spread ideas of municipal hygiene in place of useless quarantines. Inspection of dwellings and destruction of sources of infection were strongly advocated. In the United States various yellow fever and other epidemics called attention to the subject. In the City of New York, in 1866, a Metropolitan Health Board was established, organized on the same lines as the English sanitary acts. Later, in 1869, Massachusetts established a state board, and other states and cities rapidly followed. Ten years later, in 1879, Congress created a National Board of Health, and to-day municipal hygiene is receiving a great deal of attention.

Municipal hygiene in Europe has been carried to a much further degree than in the United States. At the International Sanitary Conference held in Vienna in 1874, much modification with regard to quarantine was commenced. Inland quarantine was rejected as inadmissible. The Conference of Constantinople recommended the establishment of a strict quarantine in the Red Sea, for the purpose of preventing importation of cholera into Europe, and was met with approval. This was regarded as the strategic point in the line of defense, and therefore tended to weaken reliance upon quarantine in Western ports, and medical inspection was considered as a possible substitute in conjunction with local sanitary measures. Sir John Simon, Medical Officer of the Privy Council, in his memorandum, expressed the views of the local government board upon the prevention of cholera, which greatly influenced the opinions of the delegates. The precautions recommended in detail the various means applicable for the removal of filth, and the protection of water supplies, combined with careful disinfection of the discharges of any person who might be attacked.

In 1881, an International Sanitary Conference was held in Washington, and was attended by the representatives of twenty-seven states, including all the governments of Europe, except Switzerland. They discussed measures desirable to prevent the spread of yellow fever and cholera. No uniform agreement was arrived at on all points, but some of the recommendations were adopted by many of the foreign governments. After the invasion of Egypt by cholera in 1883, and of Europe in 1884, an International Sanitary Conference was held in Rome in 1885. The interested powers were represented by their ambassadors or other diplomats, assisted by technical medical delegates. They traced the course of shipping from its point of departure from ports and

cities where cholera is endemic, for instance, Bombay, Calcutta, etc., and followed it through the Red Sea, the Suez Canal, the Mediterranean, to the open ocean. Later they considered the indications for inland precautions, and recommended the security of correct statements of sanitary conditions by the presence on big vessels of government medical officers independent of shipping companies, the disinfection on board, by means of steam chambers, of all soiled or dirty articles, the enforcement of strict precautions against the spread of cholera by the pilgrims to and from Mecca. Respecting the detention of ships, the powers represented expressed opinions that were arranged in the three following groups: Turkey, Spain, Mexico, Brazil, etc., favored the continuance of long quarantines. France, Germany, Austria, Hungary, Switzerland, Russia, Sweden, Norway, Italy and Portugal yielded to the data of modern science; whilst desiring short periods of quarantine they favored such detention as deemed necessary upon travelers and commerce; England and India advocated free passage without detention. Regarding quarantine, however, the opinions of Continental nations have been undergoing modification. At the International Congress of Hygiene, at Paris, during the exhibition of 1889, Dr. Proust, Inspector-General of the sanitary service of France, concluded a report on sanitation in seaport towns with the following propositions: "That it is the duty of governments and municipalities to render ports healthy; that sanitary works for seaport towns are more necessary than for other towns; that it is only after such works that any notable reduction in zymotic diseases and general death rates takes place, and that it is only when ports present a refractory soil for the penetration upon shipping can be suppressed." In spite of the dubious signification of the last resolution, there was ample indication that quarantine was slowly but surely being whittled down to small proportions.

Most of the microphytic diseases are found to prevail more or less in all parts of the civilized world. Certain are more prevalent in temperate zones; others are peculiar to the tropics, and are exotic in relation to this country. There are many diseases indigenous to certain tropical areas, but which are not naturalized in this country, such as Oriental plague, Asiatic cholera, yellow fever, dengue, yaws, elephantiasis, endemic hematuria, and chyluria, Oriental sore, and Madera foot. Besides these, some diseases, such as malaria and dysentery, appear in a more severe form in tropical than in temperate zones. On the contrary, scarlatina, erysipelas, whooping cough, cerebrospinal fever, and what is known as cholera nostras, are more common in temperate zones.

#### EPIDEMICS IN THE UNITED STATES.

According to the late Dr. Toner, the most important epidemics which prevailed in the United States during the eighteenth century were as follows:

Smallpox: In Boston in 1701, 1702, 1721, 1730, 1752, 1764, 1776, and 1792; in New York in 1721, 1731, and 1752; in Philadelphia in 1730-32, 1736, and 1756; in Charleston, S. C., in 1700, 1717, 1732, 1738, and 1760.

Yellow Fever: In Boston in 1796 and 1798; in New York in 1702, 1732, 1741, 1743, 1791, 1795, 1798, and 1799; in Philadelphia in 1741, 1762, 1793, 1797-99; in Charleston, S. C., in 1700, 1703, 1728, 1732, 1739, 1745, 1748, 1749, 1753, 1755, 1758, 1792, 1794, 1795, 1796, 1797, 1799; in New Orleans in 1769, 1791, 1793-95, 1797, 1799, 1800.

Scarlatina: (According to J. Lewis Smith, first im-

ported into the United States in 1735.) In Boston in 1702, 1735, 1795; in New York in 1792-94.

Measles: In Massachusetts in 1713, 1739, 1769, 1773; in New York in 1788 and 1795; in Philadelphia in 1771, 1773, 1778, 1796; in Charleston, S. C., in 1747, 1759, 1772, 1775.

Angina (Diphtheria): In Kingston, N. H., in 1733-35; in Boston in 1735, 1769; in New England in 1737, 1742, 1787, etc.

#### GROWTH OF THE HOSPITAL.

The first hospital, or rather pest-house, was established in 1403 by the proveditors of Venice, on an island near that city, but only those actually attacked by plague were at first admitted. Later several other maritime cities in the Mediterranean founded similar institutions.

Hospitals especially for the insane were established first at Feltre, in Italy, then at Seville in 1409, then at Padua, 1410; Saragossa, 1425; Toledo, 1483, and Fez in 1492.

These hospitals may be regarded, however, rather as houses of correction or penitentiaries—in Lubeck these houses of detention were called "Tollkisten" (insane boxes), and were under the charge of the jailer—than as institutions for the care and treatment of the inmates.

In 1460, in Frankfort-on-the-Main, there existed nine so-called insane asylums, each nine feet long, broad and high, one of which contained a crazy woman, another a priest, a third a crazy apothecary. Of medical treatment there was not the least thought. The insane wallowed about in chains and without clothing in these horrible dens, covered with filth and their own excrement, as long as they were able to endure. Toward the close of the Middle Ages, the treatment of the insane became a little better, especially in free cities, where compassionate citizens assumed their care instead of police jailers. This practice first started in Lubeck, in 1478. Proper houses for the guardianship of the insane were also called into existence, gradually, by the example, donations, etc., of others.

#### MEDICOLEGAL BEGINNINGS.

We find that in the twelfth century there were state physicians and surgeons as advisers in forensic medicine. In 1249, Hugo of Lucca received from the burgo-master a commission to draw up a legal opinion, and as early as 1209 Pope Innocent III recommended the appointment of such physicians in canon law. In France and in the kingdom of Jerusalem sworn surgeons were employed by cities and courts, as medical experts, as early as the thirteenth century. Physicians and surgeons were employed as public witnesses, each in his own department.

In the fourteenth century, city physicians were required to take an oath to conform to certain instructions, the transgression of which involved a penalty. In this same century there existed at Strassburg the so-called "Libenzuchter," who exercised supervision over the moral and sanitary relations of the inhabitants. Strassburg had its first city physician in 1328.

#### GROWTH OF PHARMACOLOGY.

Arabians first started apothecaries in Europe, in Italy about 1135, and in Spain in 1140, at Cordova and Toledo. Frederick II, in 1224, enacted a pharmaceutical ordinance differentiating the druggist from the apothecary. The former was dealer in spices, essential oils and raw drugs, the latter compounded medicines.

In the thirteenth century there existed in France an "instruction" for apothecaries. The latter formed a guild, about fifth in rank. In the early part of the fourteenth century they were raised to the second rank, their "masters" being allowed to wear long black gowns and wide sleeves and velvet facings, like the judges. They, with the merchants, preserved the standard weights of Paris. The physicians were their overseers. Many compound remedies were prepared by them in the presence of medical magistrates, chief among these compounds being theriaca, which was thus prepared even in the eighteenth century, so as to escape adulteration.

Germany boasts of its first pharmacy in 1233. London was the seat of the first apothecary shop in 1345. In France, in 1330, a law was enacted for the inspection of pharmacies.

The first law under State Medicine regulating apothecaries was enacted at Strassburg in 1400, and at Stuttgart in 1486, which ordinance is still in force, and reads as follows: "That drugs must always be well selected and not decayed; that nothing except what is prescribed shall be put into a medicine, especially nothing dangerous by way of substitution; that the apothecary shall be responsible for his clerks, and shall not give any pernicious drug or any abortive; that the price list of the apothecary shall be correct; that in doubtful cases he shall apply to the physician," etc.

Since the time of Frederick, inspection of pharmacies has been added as a regular public function of physicians. It was practiced at Ulm in 1426, in Frankfort-on-the-Main in 1461 and in Berlin in 1499.

#### THE FIRST PURE FOOD LAWS.

Spain in 1283 passed an ordinance relating to adulteration of food and delicacies, the sale of poisons, and love potions, infection of the air by putrefying animal matters, etc. Strict imperial ordinances against the "improvement" of wine by sugar of lead, etc., were promulgated by an imperial diet in 1475, by the Emperor Frederick III in 1487, and by Maximilian in 1497.

The penal ordinance of the criminal court directed its attention to the falsification of goods in a special section on "Falscher mit Mass. Wag. und Kaufmannschaft," and their example has been followed in the modern German Empire. Beer, too, was kept under supervision, though this and other industrial productions were mainly controlled by the guilds.

Ordinances of medical police were issued in a few cities: one in Nuremberg in 1518 regarded the sale of food, popular amusements and adulteration of wine, a thing often done even by the ancients.

#### EARLY RULES GOVERNING AUTOPSIES.

Ordinances that came within the sphere of State Medicine existed even in the Middle Ages, Germany being among the first promoters. Autopsies were, everywhere, made in cases of poisoning. Charles V enacted a criminal ordinance in the year 1530 that definitely determined the cases in which the judge should summon expert medical assistance. These were all cases of infanticide, mortal wounds, apoplexy, poisoning, concealed pregnancy and childbirth, abortion, the practice of medicine by incompetent persons, etc. However, in this ordinance judicial autopsies were not directed. They were opposed by every superstition, and it was not until 1562 that Pare made a judicial autopsy, after which postmortems frequently took place. It was from this time on that reciprocal action upon each other of medicine and jurisprudence became permanent.

#### THE FOUNDERS OF MEDICAL JURISPRUDENCE.

State Medicine in the seventeenth century occupied considerable attention of the physicians at that time. Many contributed works on this subject; others devoted special time and study to anatomy. In the early part of the century, the Pope's physician, Paolo Zacchias, wrote an independent work, renowned not only for its medical information, but especially for the legal knowledge it contained. Zacchias, I believe, is looked upon as the founder of legal medicine. Later, N. Blegny, Gendrie d'Angers and others, in France, wrote on State Medicine.

But to the Germans, during the seventeenth century, are we indebted for active cultivation of this department. Ludwig von Hoernigk, in 1638 published a work on the duties of the medical profession as a whole; Paul Ammann and Hieronymus Welsch wrote works on the mortality of wounds; Melchior Sebiz, in 1641, likewise wrote on this subject, and on the signs of virginity. John Friedrich Zittmann, Bernard Suerus and John Bohn, the latter the scientific founder of State Medicine in Germany, wrote on these subjects. Conrad Berth Behrens, ordinary physician to the court of Brunswick, and J. W. Pfeizer, wrote on the duties of the forensic physician. The Hollander, Feltmann, expatiated on the examination of corpses, and John Brown on the mortality of wounds.

#### ACTIVE GROWTH OF LEGAL MEDICINE.

During the seventeenth century, numerous ordinances of medical police, or hygienic ordinances were enacted. This period may be styled the natal era of state police, and the law included ordinances relative to plague, clothing, food, the inspection of provisions, etc.

In the eighteenth century, State Medicine was in high state of cultivation, especially in Germany. Those who are acquainted with the works of Fabricius, Buttner, Ploucquet, Valentin, Ludwig, Tropannecker, Buchholz, Schlegel, Daniel, Platner, Teichmeyer, Alberti, Eschenbach, Metzger, Pyl, Uden, Delius, Baumer, Frank, etc., know to what extent forensic medicine advanced in that country.

In France, the learned Bellocque, Prevost, Verdier, etc.; in Spain, del Valle, and in England, Farr—all are standard authors on State Medicine.

In the beginning of the nineteenth century, Pater Frank introduced the official distinction of medical police and forensic medicine. He became the champion of hygiene and was followed by Hebenstreit, von Huszty, von Nassynya, Scherf, and others.

The part of State Medicine which deals with practical instruction in sanitary science has, in Europe, been prosecuted in varying degrees in different countries. To such work as that carried on by Parkes, Klein, Creighton, Sanderson, Baxter, Smith and others in England; to the investigations of Pasteur, Chauveau, Duclaux, Chamberland, and others in France, and to the bacteriologic investigations of Koch, and the chemical studies of Pettenkofer, in Germany, are we to attribute the present position of practical knowledge of hygiene.

In some countries the instruction of public hygiene is limited, being usually confined to a course of hygiene in some medical school. In others there are institutes of hygiene on the most extended scale, as, for instance, those at Munich, Leipzig, and Copenhagen. In Hungary the province of instruction in State Medicine is of an extended character.

## KNOWLEDGE OF ANATOMY BY THE ANCIENTS.

Autopsies and dissection are said to have been made hundreds of years before Christ. The Talmud thoroughly describes the anatomy, pathology and physiology of man, speaks of the dissection of animals, and also of the human being, teaches how to skeletonize, and cites the case of a prostitute whose body was boiled and afterwards skeletonized. We also know of the two great anatomists, Erasistratus and Herophilus, in 300 B. C.

## EARLY DISSECTIONS.

Dissections have been made in every century; always with opposition by the laity. There was no regulation law by which a medical student could obtain material to study the elementary of medicine. However, we find that in the fifteenth century, Italy turned over her condemned criminals to medical colleges. It is related by writers that all condemned criminals of Italy were sent to Pisa for execution, and were frequently turned over to the anatomists of the University, who poisoned and then dissected them.

## HUMAN VIVISECTION.

It is claimed, in the History of Louis XI. that a human being was vivisected in France. It states that in 1474 a condemned robber was vivisected for the purpose of finding out where certain maladies were concentered, from which he and numerous other persons were suffering at that time. Opening and incision were accordingly done, the maladies searched for and examined, after which the bowels were replaced and the body was sewn up again. The patient's wound is said to have healed within fifteen days, and he was pardoned and given some money.

In the sixteenth century, vivisection of human beings was charged against three men, viz., Berengar of Carpi, Vesalius and Fallopius in particular, and against the anatomists of the University of Pisa in general.

Berengar of Carpi is believed to have actually vivisected two Spaniards; Vesalius is accused of dissecting a Spanish nobleman, believing that he was dead, and Fallopius is said to have been his accuser. The following paragraph is found in the fourteenth chapter of his work, "De Tumoribus": "Fever resists 'cole' poisons, as I found at Pisa while anatomizing a man. For the prince commands them to give us a man, whom we kill in our own fashion, and anatomize. To whom we gave two drachms of opium, and an attack of ague coming on (for he suffered from quartan) prevented its action. He, delighted, requested a second dose, and that we should intercede for his pardon, if he survived it. We gave him another two drachms, when he had no attack, and he died." Such history sounds possible, but not probable; however, it is from this sort of history that the ignorant public, both European and American, have become prejudiced against medical colleges and believe that human beings are dissected alive.

The regular legal inquest of autopsies and post-mortems was first established in Austria, in the early part of the eighteenth century. It was soon followed in France through the influence of Gardanne, and in Germany through that of Hufeland.

The first judicially authorized dissection in the United States was made by Dr. Shippen of Philadelphia, in November, 1762. The case was that of a negro who had cut his throat with a glass bottle, from the effect of which he died; after the coroner's jury had pronounced him guilty of self murder, his body was immediately ordered, by judicial authority, to "Dr. Shippen's Anatomic Theater."

## LAWS ON DISSECTION.

The first American anatomy law is the New York Act of 1789; since that time 34 states allow dissection; 19 states have liberal anatomy acts, while 15 have illiberal ones; the laws of 11 states are silent regarding anatomy, excepting their laws on malpractice; 31 states forbid the desecration of graves, while the laws of 11 states are silent regarding either dissection and disinterment; none of the 3 territories allowed dissection.

Ignorant and preposterous opposition of pretenders has always been a snare to the study of pathology. The county commissioners in charge of the Chicago Asylum in 1884, raised religious prejudices against postmortems, and were found to be selling the bodies to medical colleges at \$30 each for private profit.

## OPPOSITION TO VIVISECTION.

The progress of medical science, especially of physiology, biology, hygiene, etc., has called increasing attention to a higher degree of research in anatomy and physiology; to that end, vivisection of the lower animals is necessary.

At every session of legislative bodies of the various states in the Union, and of every country in Europe, an attempt is made, by a set of so-called "anti-vivisectionists" to influence legislators to enact laws against vivisection.

The fact of the matter is that vivisection is unfortunately a most misleading term to the laity. They seem to have the idea that animals are cut up alive by medical men, and compelled to suffer great pain for unjustifiable objects. A small proportion of the public know that anesthetics are administered beforehand, and that the animal is killed before sensation returns, and that such experiments must be carefully made and free from pain, otherwise they would be useless.

## VALUE OF VIVISECTION.

The question, value and character of scientific research, when carried out on living animals, has in late years been aroused by an attempt on the part of the enemies of science to entrap the influence of those who profess better things.

No physiology can advance without vivisection: experiments on living animals are as essential to its progress as is dissection for the study of anatomy. The law of sacrifice is the law of life; therefore, the law of nature, that one thing should be sacrificed for another. It is a common thing for a man to endanger his own life, to save that of another. How many physicians, nurses, etc., have lost their lives while attending to the sick and wounded in infectious diseases and in war on the battlefields.

I maintain that any person who would deny the saving of a human life at the cost of a mere dog, cat or rabbit, is a pretended humanitarian. For instance, a professor showed his students how he had saved the lives of several men by a certain operation on the brain. In order to demonstrate the operation, he performed a *fac simile* operation on a monkey, which also recovered. The professor, in his lecture, informed his pupils that before he ventured the first operation he performed it on a living monkey. Now, according to the opponents of vivisection, it would have been a lesser crime to have let several men die than to have risked the life of a monkey.

## VIVISECTION DEVELOPS SYMPATHY.

Regarding the false idea, that a physiologist takes pleasure in making animals suffer, I will say that instead of developing cruelty, the practice of physiology tends

to increase in us the feeling of humanity and pity. The physician who has closely observed human suffering, instead of being hardened by it, becomes more passionate. So the physiologists, who are acquainted with pain, are full of pity for suffering beings, and I do not hesitate to state that not one of them would be guilty of brutality toward an animal.

#### OUR DEBT TO VIVISECTION.

Take away from the science of medicine, and the art of surgery, all that with which physiology has enriched it, and the physician and surgeon of to-day would be no better than a mystery man or a quack vendor of chance-gotten drugs. Discard the present system of physiology, and all that has been gained by experiments on living animals, and the whole structure would collapse, leaving nothing but a few isolated facts of human experience.

The physiologic knowledge that we have and that we will gain in the future, if properly legislated in its favor, will benefit suffering humanity. The opponents do not stop to think that vivisection is as justifiable as the killing of animals for food. Physiology demands it for the good of all living creatures, and medical men should carry it out.

Moreover, I doubt if there is a single "anti-vivisectionist" who would miss a beefsteak for the sake of saving the life of a magnificent steer, or who would deny himself of either a veal or lamb chop in order to spare the life of a calf or that of an innocent lamb. Hundreds of millions of living creatures have already been sacrificed by epidemics, contagious and occult diseases, largely through the want of knowledge. It is unnecessary, therefore, to prove the utility and morality of vivisection. Nearly all physicians and all physiologists approve of it.

#### VACCINATION.

As a prophylactic against dangerous variola, compulsory vaccination was established early in the nineteenth century. It was first made compulsory in Germany in 1807.

Austria, Prussia, and even Russia recognized the value of the vaccine prophylactic, and made the practice general and compulsory throughout its territories, in the early part of the nineteenth century.

In 1853, in England, an Act of Parliament was passed making it a penal offence for any British subject to fail to protect himself by vaccination. In 1864, the American Medical Association, at its fourteenth annual session, held at Chicago, appointed a committee to inquire into the expediency of a national law compelling every individual in the United States to be vaccinated. The committee reported at the fifteenth annual session, at New York, in favor of such a law, but came to the conclusion that general compulsory vaccination in this country, at that time, was impracticable, owing to the unpleasant condition of our nation at that period.

#### TUBERCULOSIS.

But the time has now come when the medical profession should show the national supremacy, by their united action in demanding enforced national legislation for the protection of its inhabitants from infectious diseases by compelling every man, woman and child not only to be vaccinated, but also to take precaution against infectious tuberculosis.

Koch's first investigations revealed tubercle bacilli in the dust that had been contaminated by the sputa of phthisical patients, and the comma bacilli of cholera in the mud-banks of Indian water-tanks. Kitasato of

Japan, and other observers have found tetanus bacilli in the soil.

These and numerous other experiments have proved the presence of pathogenic microbes in the soil. Those investigations endured a great amount of experimental work under the auspices of various governments, such as France, Germany, Austria, England, Russia and the United States. The field of contagious animal diseases is in a much more advanced state, controlled, as it is, by the Bureau of Animal Industries, under the Department of Agriculture.

#### TUBERCULOSIS MORTALITY.

According to statistics, tuberculosis kills one-seventh of all the population of the world, and one-third of all deaths occurring between the ages of fifteen and sixty years are due to tuberculosis. Furthermore, it destroys four and a half times more people than do smallpox, scarlet fever, typhoid fever and diphtheria combined; that in America 1,200,000 people have the disease at all times, or one in fifty persons.

Dr. Mullins, of Sydney, Australia, reports for a period of twelve years, 17,114 deaths from tubercular disease in New South Wales. Of these 12,430 were from phthisis, 2241 from tabes mesenterica, 1325 from tubercular meningitis, and 1018 from other forms of tuberculosis. During the year 1898, in the state of New York alone, there were 12,979 deaths due to consumption; of this number, 7825 were in the city of New York.

#### BOVINE TUBERCULOSIS TRANSMISSIBLE.

Dr. Charles Creighton emphatically says: "I can not escape from the conviction that the peculiar errors of nutrition in the domesticated bovine species all over the world are the real fountain and source of human tubercle."

A strong confirmation of the view that bovine tuberculosis is transmissible, at least to young children, is contained in the fact that the mortality of children under five years of age from primary tubercular ulceration of the intestines, and from tuberculosis of the peritoneum and mesenteric glands (tabes mesenterica), is very high.

According to bacteriologic investigation, the bacilli of bovine tuberculosis have been found to be identical with those found in tubercular formations in the human organs, although the disease is anatomically different in man than in cattle. These differences are considered due to differences of soil in the human and bovine tissues, the bacilli engrafting themselves in those tissues which present conditions most favorable to their growth and development.

It has been found that the milk of tuberculous cows containing tubercle bacilli, when administered as food, produced tuberculosis in dogs, guinea-pigs and rabbits.

#### WHAT STATISTICS PROVE.

Woodhead states that in 127 cases of tuberculosis in children examined by him he found tubercular ulceration of the intestine in 43; whilst in 100 cases, or nearly 79 per cent. of the whole, the glands connected with the intestinal tract were in some stage or other of tubercular degeneration. Woodhead contends that tuberculosis connected with the intestine is of frequent occurrence in children, infection frequently taking place by the alimentary canal.

It is a curious fact that wise men occasionally fall into errors, strange and unaccountable. I trust that the error recently made by Dr. Koch, at the British Congress

of Tuberculosis, that bovine tuberculosis is not infectious to man, will not retard the action and movements of scientists against the dangerous infection from bovine tuberculosis. If Koch does not believe the identity of human and bovine tuberculosis, we will simply refer him to the observations of Tscherming of Copenhagen, Pfeiffer of Weimar, Law of Cornell University, Williams of the Brompton Hospital, Cozette of Noyon, France, and many others who report infectious cases of bovine tubercular infection.

#### ILLUSTRATIVE CASES.

Tscherming relates the case of a veterinary surgeon, who cut his hand while making a postmortem examination on a tuberculous cow. Although the wound healed, a swelling remained which became ulcerated and refused to heal. Eventually, the whole mass was removed, and microscopic examination revealed the presence of tubercle bacilli. Pfeiffer relates a similar case of a veterinarian, aged 34, of good constitution and free from hereditary taint, who wounded himself deeply in the left thumb. The wound healed, but about six months afterward a cutaneous tuberculosis was diagnosed at the site of the scar. A year later the patient manifested undoubted signs of pulmonary tuberculosis; the sputum was found to contain tubercle bacilli, and the patient died two and a half years after receiving the wound. Postmortem examination revealed tubercular arthritis of the wounded thumb, and extensive tubercle and cavities in the lungs.

Law reports another case of a veterinary surgeon, who was wounded in the hand while operating on a tuberculous cow, and suffered from a tumefaction of the resulting cicatrix, with distinct tubercle bacilli. The tumefaction was surgically removed, and was evidently the means of saving the patient from a generalized tuberculosis.

Cozette, a French veterinarian, relates where a consumptive attendant had infected two cows, which, when handed over for slaughter, were condemned because of their markedly tuberculous condition; however, those two had infected seven others, who became ill, and were killed. Autopsies demonstrated clear cases of tuberculosis.

Law cites the case of a healthy child, aged one and a half years; while at a relative's house for one week it drank the milk of a cow which soon afterwards was condemned and killed. Autopsy revealed generalized tuberculosis. The child gradually emaciated, death occurring three months later from abdominal tuberculosis.

Professor Gosse of Geneva cites the case of his own daughter, who died from intestinal and mesenteric tuberculosis, which he attributed to the milk the girl drank daily, fresh from five cows, on his estate. They were all slaughtered and two of them showed tubercular disease of the udder.

Demine of Berne reports the case where four infants in the Hospital Jenner, whose parents were all healthy, with no tuberculous history, died of intestinal and mesenteric tuberculosis as the result of drinking the unsterilized milk of tuberculous cows.

Brouardel likewise records a case where five out of fourteen young girls living together in a boarding-school became consumptive, subsequent to the daily use of milk from a tuberculous cow. We could cite hundreds of similar cases to convince our friend Dr. Koch of his mistaken ideas of bovine tubercular infection.

Now, if the lactile secretion is infectious, there can be no doubt that the meat from animals which suffer from

even a localized tuberculosis is not fit for human consumption; furthermore, we have ample proof that a localized tuberculosis will naturally find its way into the muscular structure or other parts of the carcass used as a food; therefore, such meat should and must be condemned.

#### IMPORTATION OF DISEASED ANIMALS.

Most all civilized countries have and should have some laws for the prevention of importation of epizootics by foreign live animals. Limited space and other considerations naturally prevent long periods of quarantine or observation and detention of those animals intended for exhibition or re-shipment, or for other special purposes. Many infected animals are slaughtered at the port of arrival, and suspected live animals are frequently excluded.

In 1848, the English Legislature employed numerous means to prevent the importation of sheep, cattle and other animals suffering from contagious or infectious disorders, and gradually further powers were granted until their consolidation and perpetuation in the Contagious Diseases (animals) Act of 1869. Great devastations continued as the result of epizootics, and serious legislative efforts were made until again codified in the existing Act of 1876, to which amendments were added in 1884, 1886 and 1890; so that, as in certain human communicable diseases, the contagious diseases of animals are also subject to compulsory declaration, isolation, and disinfection, with the additional powers of prohibited importance, quarantine and slaughter.

#### GOVERNMENTAL CONTROL.

In July, 1891, a congress for the study of tuberculosis in man and animals was held at Paris, and the following resolutions were passed:

"It is necessary that all governments should decree the most efficacious prophylactic measures for preventing the extension of bovine tuberculosis. It is urgently necessary to establish a special inspection of meat in all towns, without exception, provided with a public abattoir. It is equally necessary to suppress all private slaughter-houses in towns containing more than 5000 inhabitants, and to replace them, as soon as possible, by public abattoirs; effectual inspection is impossible without this measure."

Tubercular subjects, man and beast alike, should be subject to quarantine restrictions; and its control should be part of the duties of either a national, state or municipal board of health.

The expectoration of sputum of tubercular patients should be prohibited in public places, public vehicles and even on the highways. If the oral secretion is infected with tubercular deposits and dries on the floor it is likely to pulverize and float about as dust; thus inhaled, it is a means of spreading tuberculosis. It may be difficult at first to enforce such an ordinance, but a law of this sort will certainly have a moral effect, and eventually an educative action on the public, who will consider it indecent and disreputable to spit in public places. It will likewise educate the public to look upon public spitters with contempt.

The National Board of Health, which was established in 1878, was appointed and supplied with grants by the Federal Government, which enabled the board to institute investigations of great importance regarding the causation of disease, etc., has unfortunately, through political prejudice, withheld its influence, so that very little practical work has been done, and was finally abolished. But the Marine-Hospital Service, with the late

Dr. John B. Hamilton, and the present Dr. Walter Wyman at the head of that department, protected the country against foreign importation of infectious and contagious diseases.

#### TUBERCULOSIS SANATORIA.

S. A. Knopf, of New York, before the Conference of the State and Provincial Boards of Health of the United States, delivered an address upon the state and municipal care of consumptives. He believes that a commission should be provided for the examination and care of tuberculous subjects; to determine their physical condition; to investigate their surroundings and the dangers to their families; to render their homes sanitary, if possible, and, if necessary, to endeavor to remove the patients to an institution. Anyone should have the privilege of being examined, and all physicians should have the privilege of recommending patients for examination. The institutions for the care of these individuals should comprise a reception hospital and dispensary, located in the city; a suburban sanatorium, in an elevated region, if possible, this to be used as a temporary hospital for patients subsequently to be sent to a mountain sanatorium, which should, if possible, be elevated from one thousand to two thousand feet above sea level. There should also be seaside sanatoriums for the treatment of children with tubercular disease of the joints and glands, and a maternity sanatorium.

Knopf also quotes the greatest authorities of the world, who are in favor of such a movement—Dettweiler, Leyden, and Liebe of Germany; von Schrotter of Austria; Grancher, Letulle and Petit of France; Weber, Lindsey and Sangmann of Denmark and Sweden; and in the United States, Bowditch, Hamilton, Biggs and Prudden, Lee, Trudeau, Flick, Hinsdale, Otis, Shradly and others, all strong advocates for the establishment of state and municipal sanatoria for the care and treatment of the consumptive poor.

The crowned heads of Europe, such as the Czar of Russia, the Empress of Austria, the King of Saxony, the King of Sweden, and the young Queen of Holland, have placed the sanatoria for the consumptive poor under their high protection, and have opened their private purses for their support. The nobility and the leaders in finance, art, and literature have been eager to imitate the noble example set by their sovereigns, and the latter, too, have given freely toward the erection and maintenance of such institutions.

Thus, in the countries just mentioned, a number of establishments now flourish which are doing a world of good by curing the curable tuberculous cases, and taking care of the hopeless ones, thus diminishing countless centers of infection.

Dr. Knopf justly says: "Let me further advise the statesman, physician or philanthropist who doubts the need of such institutions in the United States, to visit the consumptive poor in the tenement districts of our large cities, and study the hygienic and social conditions of these sufferers in their surroundings."

#### NATIONAL BOARD OF HEALTH AND EXAMINERS.

It is the duty of every citizen, as well as of the physician, to insist that our National Congress establish a medical bureau of the Department of the Interior, for the purpose of regulating the various professions that battle for the welfare of suffering humanity.

First, to establish a federal board of medical examiners, under the auspices of a medical bureau of the Department of the Interior, so that any physician, den-

tist or pharmacist may follow his profession in any part of the United States, or in any of its territories, thus granting the privilege to its citizens to invite a physician or dentist from any part of this country to ameliorate their sufferings.

Second, under the auspices of the same bureau, there shall exist a national board of health, consisting of men of learning and ability, competent to make bacteriologic and chemical examinations, for the purpose of preventing the spread of the various contagious and infectious diseases, the adulteration of food, and the sale of infected cattle, and to restrict the sale of the so-called patent medicines.

Third, the bureau shall have jurisdiction over the registration of births and deaths, census and vital statistics in general.

#### REGULATION OF MARRIAGE.

It is also desirable to have a national law pertaining to marriage and divorce. The unfortunate conditions of either, each state having its own laws, demand immediate action of Congress for the regulation of this evil.

Marriage should be prohibited to blood relations up to the second degree, and to all persons of either sex affected with either congenital or acquired specific or infectious disease, such as venereal or pulmonary affections, confirmed drunkards, criminals, anarchists and degenerate classes.

Each applicant for a marriage license should present a certificate from a medical examiner, appointed for that purpose, stating that the applicant is not affected with any disease or habit that would be derogatory to procreation or offspring. When parents are tainted with specific disease, it is almost invariably looked for and expected with the children. A taint of hereditary drunkenness, insanity, suicide, epilepsy, idiocy, deaf-mutism, cancer, syphilis, gout, rheumatism, tuberculosis or scrofulous diathesis in the blood, are all symptoms of degeneration, likely to be intensified by propagation in succeeding generations, until the tainted family becomes extinct. Intermarriage with those tainted diffuses weakness, deformity, and abnormality through the social structure, deteriorates and contaminates all who issue from such unions.

Intermarriage of distinct diseases are as dangerous as the union of two consumptives. A typical case, cited by Richardson, will corroborate this statement: "A young man, of marked cancerous proclivity, married a woman whose parents had both died of pulmonary consumption. This married couple had a family of five children, all of whom grew up to adolescence, sustaining at their best but delicate and feeble existences. The first of these children died of lupus; the second of simple pulmonary consumption; the third, owing to tubercular deposit in the brain, succumbed from epileptiform convulsions; the fourth, with symptoms of tubercular brain disease, sank from diabetes, the result of the nervous injury; and the last, living longer than any of the rest, namely, to thirty-six years, died of cancer. The parents in this instance survived three of the children, but they both died comparatively early in life; the father from cancerous disease of the liver, the mother from heart disease and bronchitis."

While we have some states prohibiting consanguineous unions, there are others that have not kept abreast with modern civilization, and allow the marriage of near kin. There is not a physician who is entitled to that name who does not know the physiologic reason for prohibiting

consanguinous marriages; but for the benefit of those who do not know, I will state that besides degenerations, a marriage between persons closely allied in blood is apt to produce an offspring feeble in body and a tendency to insanity in mind.

As to confirmed drunkards, I can only repeat what Plutarch says—"One drunkard begets another"; and Aristotle adds: "Drunken women bring forth children like unto themselves." Dr. Howe, in a report to the Legislature of Massachusetts, says: "The habits of the parents of 300 of the idiots were learned, and 145, or nearly one-half, are reported to be known as habitual drunkards." Howe cited a case in which the parents were drunkards, and had seven idiotic children.

#### PROPHYLAXIS AGAINST ANARCHY.

Another dangerous disease with which the world has to contend, and which has lately shocked our nation, and in fact the whole world, is anarchy. The murderous assault upon the President, aimed as it was at the life of the government, imperiled the security of the whole country. The right of self-preservation is as vital to the State as to the individual.

The entrance of foreign anarchists must be strictly prohibited as well as other infectious matter. Their teachings are as poisonous as the bite of a snake, and as dangerous as the swords and bayonets of a hostile nation. The pestilence of the teachings of the anarchists who dwell amongst us can not but have influence upon their offspring; therefore there must be a law preventing their marriage. The characters possessed by an individual are mainly congenital, peculiar to each individual in type and variation; therefore, the offspring bear a typical likeness and character to the parents.

Criminals and murderers may regret and repent their crimes, confess and receive absolution, and, after their execution, may go direct to heaven; but society is better off with such individuals in heaven than on earth.

A great deal can be said in favor of a national law of divorce. But what mainly interests us is the medical portion. According to medical jurisprudence, impotence in man and sterility in woman, or any impediment to procreation of children, is absolute ground for divorce; however, what we desire to add is that specific and infectious disease endangering offspring shall likewise constitute grounds for divorce.

#### PUBLIC BATHS.

The public bath is another necessity to municipal hygiene. The ruins of the *caracallas* of Rome speak clearly of the glorious bathing establishments of the fifth century; though in a state of decay, yet they show the inclinations and habits of the people who prevented municipal filth. It is said that Rome had at one time 856 public baths. In the Middle Ages nearly every village and town is said to have had its bathroom with wooden tubs. Russia, Turkey and Japan are renowned for their public baths, which are accessible to the poorest classes upon the payment of a very slight fee.

France, Belgium and Austria have kept apace with other countries. The United States, unfortunately, has done very little towards this hygienic problem. The only baths provided in this country by municipalities are a few floating or swimming baths in New York and in Chicago. The New York baths were authorized by the Legislature of that state. About twenty such establishments exist in that city to-day. Another act in the Empire State, in 1892, authorized any city, village or town in the state to establish public baths, and to loan,

credit or make appropriations for that purpose. I trust that the great state of New York will continue its good work, and that other states will follow. It is admitted, that if you deprive a man of his bath you lower his moral tone: "soapology" and "scrubology" as well as "theology" are recognized by General Booth, of the Salvation Army, as potent Christianizing agencies.

#### RESTRICTION OF VENEREAL DISEASES.

Compulsory examination of prostitutes is another necessity for the purpose of preventing the spread of venereal diseases. It is said that either the City of New York or Chicago contains, at the present day, venereal infection sufficient to contaminate the male population of the United States in a very short space of time.

We do not want legalized prostitution as it exists in European countries. I do not believe in authorizing houses of debauchery and making of prostitution a regular profession. The State has no right to regulate prostitution. I am proud of my country, which is fortunately free from the incubus of State regulated vice.

All that is desired is a state law for municipal governments, to keep a register of all women known or suspected of prostitution, and that such women shall be liable at any time to be called in for examination. But no certificates should be issued to them, as to their healthy or unhealthy conditions, for such a certificate would simply encourage the vice. However, if found affected with a venereal disease, they should be sent to a detention hospital or sanatorium, and should be detained there until cured.

#### DETENTION OF SYPHILITICS.

I firmly believe in the law of Massachusetts, for the detention of certain persons affected with syphilis, in which it is enacted that persons suffering from syphilis, and being inmates of any correctional or administrative institution, such as a house of correction, a penitentiary, or a work-house, shall be placed under medical treatment, and be isolated until the medical attendant shall consider further isolation unnecessary; and if, at the date of discharge of a person, syphilitic symptoms are still present, likely to prove a public danger, compulsory detention may be put in force to retain the infected person until such a time as dangerous symptoms have been pronounced to be no longer present.

A suitable hospital or sanatorium devoted to diseases peculiar to prostitutes should be established in each and every city, with the power to place and keep there all women so diseased until cured. The amount of accommodation required should depend upon the size of the population, and there should be at least one bed to every thousand inhabitants. Payment could and should be required from all who possess the means of expense actually incurred, and this would contribute a considerable sum towards the expenditures of such an institution.

It should not be intended as a prison, for such is directly contrary to reformation. Liberal arrangements as a hospital would afford no encouragement to vice, and certainly help wonderfully to eradicate the evil.

#### ABOLISH THE CORONER.

There is one law, a relic of barbarism, that I should like to see abolished, and I know that the profession would heartily approve of it: that is, the office of county coroner; and in its stead a medical examiner should be created. Such a law was established in Massachusetts

about fifteen years ago, and gives great satisfaction from both a scientific and financial point of view.

#### CONCLUSIONS.

All foregoing regulations, if established, will, I am sure, tend to improve the moral and physical welfare of our Nation.

State Medicine is a creation of necessity in times of public danger, but its future development will be in proportion to the scientific character of its work, and to the appreciation on the part of the public of the economic and beneficent results of such work.

The world's rapid transit and intercommunication brought on the high state of civilization, and made the whole human race one family, so that people of every color, clime, language, government and creed have become one brotherhood, with a law of love and care for one another which fulfills the golden rule—"love your neighbor as you do yourself."

### Original Article.

#### A SIMPLE AND ACCURATE METHOD OF OUTLINING THE STOMACH.

WILHELM BECKER, M.D.

MILWAUKEE.

The determination of the outlines of the stomach has always been and always will be a matter of great interest to the gastro-enterologist. It is not necessary to name and describe the advantages and disadvantages of the various methods of outlining the size of the stomach, nor will space allow me to do this.

During the last two years I have tried a simple and accurate method which has given me great satisfaction. By its employment I have determined the size of the stomachs of about three hundred patients of all varieties. A considerable number of these patients were free dispensary patients of the Milwaukee Medical College and I take this opportunity to extend my thanks to Prof. W. H. Nielson for generously placing the gastro-contingency of the college clinic at my disposal.

The following is a short description of the method: The patient's stomach is washed out in the ordinary way. Turck's double tube is best used for this purpose. About two hundred c.c. of clear water are left to remain in the stomach. Next, the patient is placed in a horizontal position upon a table with the tube *in situ*. An ordinary atomizer bulb is attached to the inlet tube. The outlet tube is firmly compressed. This compression is best effected by kinking the outlet. Then a stethoscope is placed over the region of the stomach; air is gently introduced by compressing the atomizer bulb. As the air enters the stomach, passing through the stratum of water which has been left in the organ, a gurgling sound will be produced thereby, which is heard very distinctly with the stethoscope or even by immediate auscultation. In moving the stethoscope downwardly towards the supposed borderline of the stomach, the sound produced will be entirely different as soon as the stethoscope is beyond the border, i. e., the sound will be muffled and indistinct. The difference between the sounds over and beyond the stomach is very marked and even a relatively inexperienced one will not fail to see the difference.

After the stomach is moderately distended, the outlet tube is relaxed and the air let out again. The whole procedure is repeated until the borderline of the organ has been ascertained in all directions, the lesser curvature as well as the greater, the right as well as the left border. In trying to ascertain the location of the lesser

curvature, however, it is advisable to attach the atomizer bulb to the outlet tube, since the gastric end of this lies farthest away from the cardia and thereby modifies the sound which would otherwise be too loud to admit of a fine discrimination.

It is essential that the organ should be slightly distended. Organs flabby and empty will transmit the sound easily into the surrounding tissues and organs, the same is true of hollow viscera, distended to the utmost. I would therefore advise not to lose sight of these details, since failure to do so has often marred the clearness of the findings and may be a source of error for the inexperienced. There are other conditions which at times seem to be disturbing factors. I have up to the present time been unable to locate them or to ascertain what they are, and I admit that sometimes the results of this method are not as satisfactory as might be desired.

Continued use of the method will, I hope, enable me to find these disturbing factors.

In conclusion, I would like to point out some advantages of the method.

It requires a simple apparatus and simple technic.

It is more accurate, simpler and less cumbersome, both to physician and patient, than gastro-diaphany.

It is less painful than percussion after distension with CO<sub>2</sub> or air; and since the distension is only a partial one, it will not, as the over-distension for percussion often does, give exaggerated outlines.

It has lately been tried to outline the colon by using a similar method, but I do not anticipate as favorable results as in the case of the stomach.

The findings by means of this method were controlled with Turck's gyromele, the percussion method and on the cadaver. In the cadaver, results are less satisfactory.

# THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION

---

61 Market Street : : Chicago, Ill.

---

*Cable Address: "Medic, Chicago"*

---

*Subscription price: Five dollars per annum in advance*

---

SATURDAY, JUNE 14, 1902.

---

From the fact that our forms are now closed on Wednesday afternoon, we make no attempt this week to give the proceedings of the American Medical Association. The official report will appear in next week's issue.

## THE ADDRESS OF THE PRESIDENT.

Dr. Wyeth's presidential address, which is published in this issue, is suggestive in a number of ways. His suggestion of the need of a uniform standard of medical qualification is brief but timely, and should receive the earnest attention of the profession generally. If its sentiment on this point is strongly and generally voiced, the end will be attained, if not at once, at least at an early date. That it is practicable is beyond question, as our Canadian neighbors have demonstrated. The remarks on section papers and on branch organizations are likewise intimations of what must commend itself to every one. The recommendation of permanent places of meeting, while doubtless not novel to everyone, is worthy of serious consideration whatever may be the outcome of the discussion. The present inadequacy of the Army medical force and the prospect of matters becoming worse before they are better, are living questions not only to medical men, but to all who have the welfare of our country and its soldiers at heart. We believe the Association, both in the session and through its individual membership, will speak with no uncertain voice on this matter. The present status is an illustration and a result of our lack of influence as a profession, due, as he says, to insufficient methods of education and to our lack heretofore of thorough organization. We cannot always, with human nature as it is, prevent quacks gaining the confidence of the public, but we can make ourselves more respected when our essential standards of qualifications are uniformly more respectable and when we have shown that we possess in our professional and civic capacities influence that no one can despise or disregard. All these are possible and we may say are realities of the future, but we need not passively wait for them to come to us.

These are only part of the suggestive features of the address; it is a valuable summary of the leading and living questions to be considered at the present session of the Association. Some of them are to be definitely settled in the near future, others, it may be, only in the remote future. We owe it to ourselves and to all those

whose welfare we have at heart, to see that the outcome is not in any way a disappointment.

## GAS LEAKAGE IN LARGE CITIES.

There has been a widespread feeling for some time that the immense amount of gas leakage known to take place from the gas mains of large cities constitutes not only a serious menace to property, because of the possibility of explosions and the added risk of fire entailed by the presence of so inflammable an agent, but also a manifest danger to health because of the contamination of the atmosphere of houses by a very poisonous element. At the last meeting of the New York County Medical Society new light was thrown on this interesting subject from the standpoint of the gas expert as well as the physician. Some of the data furnished are rather appalling. The information has evidently been jealously guarded up to this time. When it is realized that gas leakage in such cities as London, New York and Chicago amounts to many million feet of gas per day, some idea is obtained of the enormity of the risk to property and life involved.

Gas leakage is constantly on the increase, and so far no serious consideration has been given to it and no precautions taken to secure mitigation of the evil. Even the boards of fire underwriters confess that they have found gas companies too well entrenched in the legislatures for them to be able to secure legal enactments that would protect cities from the possible effects of the present enormous leakage. The fact of the matter is that it is cheaper for gas companies to pay for this costly item of waste rather than thoroughly relay their leaking mains in such a way as to prevent the loss. Gas mains, as a rule, when originally laid were not of material well calculated to stand the wear and tear of soil conditions for a long term of years. Nor were they primarily intended to carry the amount of gas that latter-day demands have necessitated. Leakage is in inverse ratio to the size of the pipe used to convey gas, but in most cities extra mains of comparatively small diameter have been laid rather than single large mains that would be so much safer. Besides, gas has become more and more dangerous as its manufacture has cheapened. The original coal gas contained about 7 per cent. of the very dangerous ingredient, carbon monoxid. At the present time water gas forms almost exclusively the basis for illuminating gas, and in this product over 30 per cent. of the gaseous materials consist of the odorless, treacherous carbon monoxid.

Street conditions, too, have served to increase the dangers from gas leakage. Most city streets, especially in residence districts, are covered with asphalt. This is, as a rule, impervious to gas and, as the sidewalks as now constructed are equally so, the escaping gas finds its easiest exit from the confined space beneath the pavement through the walls of contiguous houses. Some of the gas, it is true, finds its way into sewers and creates dangers for the workmen in manholes and excavations

or, because of its very high diffusibility, gets into the sewer pipes of houses and finds an avenue even into living rooms. During the process of filtration through the soil the deadly water gas becomes separated from the naphtha compounds with which it was mixed in order to give it illuminating power. It is to these naphtha elements that gas owes its characteristic odor. The soil filtration then concentrates the poisonous qualities and removes the only danger signal. The gas is even more diffusible when thus stripped of its carburetted elements. It is not hard to understand, then, how great is the danger from such gas diffusion. In the winter, particularly when the ventilation of basements is imperfect, whatever gas finds its way within the walls becomes mingled with the house air. Even a very small percentage of carbon monoxid causes air to become an actively depressant poison.

At the meeting of the New York County Medical Society Dr. Lloyd called attention to some cases in which it seemed clear that the breathing of gas-contaminated air was the cause for certain obscure pathologic conditions with symptoms of anemia and headache accompanied by febrile disturbance and obstinate to all medical treatment. These cases occurred in small groups in both sexes and yielded to treatment only after removal of the patients from the house in which they had been living. Careful examination of several of the houses showed the existence of serious plumbing defects. It is rather generally conceded now that the evil effects of so-called sewer-gas are really due to contamination with carbon monoxid from escaped illuminating gas. It has long been known that even small proportions of carbon monoxid in inspired air may cause anemic conditions with nervous complications. In a series of lectures delivered in Berlin some three years ago,<sup>1</sup> Prof. Ernest Grawitz, the well-known clinical authority on blood diseases, suggested prolonged gas poisoning as a cause even for progressive pernicious anemia. The greater frequency of this disease in large city life in recent years suggests the possibility of some such cause being at work. The severe secondary anemia in individuals of unstable blood equilibrium, so prone to develop in city residents, might well be due to this hitherto ignored factor.

There is no doubt that this question furnishes important material for careful consideration by the boards of health of all large cities. The amount of gas leakage from city mains should be an item constantly on file for sanitary officials. Physicians should be able to find out from authentic data how much gas is escaping in a given district. The quality of the gas furnished should also be a matter of record, so that there may be some control of the amount of the cheaper, but far more poisonous water gas supplied. This material is being used in increasingly large proportions by gas companies. For the sake of public health, gas companies need to be aroused from their present apathy with regard to these extremely important subjects. If necessary legislative

enactments should be secured to regulate the abuses which have apparently been allowed to reach too great proportions without proper protest.

#### CITY CHILDREN DURING THE SUMMER.

The problem of what to do with city children during the summer has been much discussed and much good has resulted therefrom. When we remember how high the mortality among young children in large cities rises during the hot months, we can appreciate how important it is to do as much as possible to reduce it. Children whose parents are able to take them into the country, to the seashore or to the mountains during the summer are most fortunate. The great majority of city children, however, must stay at home all summer, and among the poor the mortality from summer diseases becomes very great. The efforts which are being made to provide better conditions for such children who live in crowded quarters are most commendable and deserve hearty support. A recent writer has said that the most noticeable movement in educational lines of recent years has been the rapid development of vacation schools and playgrounds in all the great cities of America. While a comparatively small, open playground is by no means a complete substitute for the country, it is a great improvement upon a narrow, dusty, dirty street with its street cars and other traffic. Many children die each year in cities from injuries by street cars and other vehicles, sustained while playing on streets. Children must play somewhere, and if suitable playgrounds were provided, many of these accidents could be avoided.

While the lot of the poor child in the crowded city during the summer is always sad, it is particularly so when the child is so unfortunate as to be sick. Efforts to get sick children away from the city heat have resulted in the saving of many lives.

The particular method adopted for accomplishing this have varied with the location and surroundings of the city. The new floating hospital or hospital boat planned for Boston is to be most complete. It is to be 192 feet long, 44 feet wide, and is to have four decks. The equipment in every particular is to be equal to that of a first-class hospital on land.

In other cities hospitals and sanatoriums are placed upon piers, so that the little patients have the advantage of fresh, cool air from the ocean or from one of the great lakes. The effect of such air upon sick children is simply marvelous, and those who are rapidly losing ground in their unsanitary, hot homes begin at once to improve after their surroundings are changed. Improved milk supplies have done much to diminish gastrointestinal diseases among city infants, and practical philanthropy has found a most useful employment in furnishing pure milk to poor families at a nominal price.

With improved sanitary conditions, pure foods and more fresh air, the infant mortality in cities will be much lower than it is at present, and this will in some measure compensate for a lower birth rate.

1. *International Clinics*, Series 9, vol. II, p. 72.

## THE STIMULUS OF SUNLIGHT.

The effect of sunlight on population has been studied by M. Lugeon in the Canton Valais, Switzerland, and a brief statement of his results is given in *Science*, June 6. He finds that in the principal valley of the canton, between Martigny and the Rhone glacier, there is a marked difference in the populousness of the two sides of the valley: that most exposed to the sun having decidedly the largest population, and this does not appear to altogether depend upon the physical conformation, but he is inclined to attribute it mostly to the different exposure to sunlight. With one or two exceptions all the villages are on the sunny side of the valley and the dwellers on that side form a sort of aristocracy, being more prosperous and better educated and look with some contempt on their poorer neighbors on the shady side. In one village there are actual caste differences corresponding to the difference of exposure to sunlight of the dwellings. Of course, this may be largely a matter of voluntary selection: the abstract is not complete as regards possible physical differences in the people, but the publication of the study is suggestive from a medical as well as from a sociologic point of view.

## VACATIONS FOR CITY PEOPLE.

With the beginning of summer the city dweller begins to look forward to his summer outing in the country, and he plans how to escape as much of the heated season in the city as possible. Each year witnesses a more general tendency for business houses to give their employes a chance to spend a short time in the country during the warm months, and a half-holiday on Saturday during the summer has become almost universal. Provisions are made in many cities by which working girls and boys, who are unable to pay for a summer outing in the country at the usual prices, are allowed to obtain it free or at a slight cost. It is impossible to estimate the value which such vacations possess in preserving and restoring health, and if employers fully realized the fact that more and better work can be done by fresh and healthy employes than by exhausted and depressed ones, much more attention would be given to providing the workers with opportunities for more recreation, not only during the summer, but throughout the year, by giving a weekly half-holiday, and by requiring shorter hours of work at such times as business would allow it.

## THE INFLUENCE OF VARIOUS BATHS UPON GASEOUS INTERCHANGE.

It has been contended that the hot bath acts especially as a counter-irritant or derivative measure, exerting almost specific influence in the presence of capillary bronchitis, and being comparable to a mustard-plaster applied to the entire body. To determine the part played by the irritation of the skin and also the effect upon the gaseous interchange Dr. H. Winternitz<sup>1</sup> undertook at the Medical Clinic of the University of Halle a series of comparative observations, as a result of which he found that under the influence of sand-baths there occurs such a marked increase in the consumption of oxygen and in the production of carbon dioxide as to ex-

ceed considerably that attending even highly febrile processes. At the same time, as compared with hot baths, the increase in bodily temperature is moderate and the change in the general condition slight. Saline baths cause inconsiderable increase in oxidation processes, while baths exerting a markedly stimulating influence upon the skin—such as mustard-baths—cause considerable increase in heat production, in the absorption of oxygen and in the production of carbon dioxide. Absorption of carbon dioxide takes place in carbonated baths, and this is of significance for therapeutic purposes. Sulphurous baths are without effect upon the gaseous interchange.

## REACTIONS AMONG MENTAL HEALERS AND FAITH CURISTS.

Some recent reactions in circles previously devoted to the entire repudiation, not to say villification, of medical science are worth noting. First: Newspapers report that vaccination has been allowed in Dowie's "Zion," and that this leader, being unable to save his own daughter from a painful death, sought the services of a practicing physician. Second: While cases, of course, are not published, owing to established professional ethics, it is well known to the profession that physicians are nowadays often being consulted by Eddyites, even by prominent members of the sect, and that occasionally some of these are to be found in our hospitals. Third: The lecturer for a certain mental-healing society tells her followers distinctly that if they need a physician they had better go to one. However, this advice apparently contains a covert reflection on their inability to be helped by mental influence. Fourth: On account of the learning and practical life of the editor, the most dignified authority on current theory and practice of mental healing is a monthly periodical called *The Higher Law*. For the last year or two its pages have shown more and more acknowledgment of the physical factors in disease. It has been stated there that mental healers are specialists, that the whole truth lies deeper than mental healers have sounded. It is explicitly proposed that believers in the allness of the mind should study physiology, and so get a look at things from a new standpoint. "If a mind-curer helps you, well and good. But do not hesitate to learn from the best doctor at hand."<sup>1</sup> Whether it involves hypocrisy and insincerity, or whether it is accomplished by honest steadying of the reasoning powers, it seems by all these signs that the light of common sense is sure sooner or later to break through any cloud of fanatic prejudice or wilful ignorance which may be raised in these days when so many of the real facts about disease can be readily known.

## THE CURATIVE ACTION OF FLUORESCENCE IN MALARIA.

The various forms of phototherapy and radiotherapy have excited much attention recently and are being given extensive trial in various diseases, especially of the skin. Dr. A. F. A. King in recent articles<sup>2</sup> brings forward a number of facts to show that the curative action of quinin in malaria may be due to its fluorescence where-

1. Deutsches Archiv für klinische Medizin, 72 B., 3 u. 4 H., p. 258.

1. Editor's Study. *The Higher Law*, May, 1902.

2. *Americ. Journ. Med. Sc.*, February and June, 1902.

by it produces violet rays of light in the blood. King starts from the assumption that the malarial ameba like *Ameba proteus* streams in red light, but not in violet, hence quinin would arrest sporulation of the malarial parasite. As further evidence, King cites the fact that two other vegetable products, namely esculin and fraxin, both of which produce a blue fluorescence, are effective remedies for malaria. King then goes on and shows that in 1886 Henry Bence Jones discovered a fluorescent substance in the tissues of guinea-pigs and of man, which substance he called animal quinoidin. Rhoads and William Pepper of Philadelphia two years later took up the question, suggested by Jones, whether there might not be a rapid and marked diminution of normal "animal quinoidin" in malaria diseases, and they found that the fluorescence of the blood of malaria patients is below the normal standard. Furthermore, that this fluorescence is increased by quinin at the same time as the symptoms improve. Mills, in 1875, supports this conclusion. In order to explain the malignant cases of malaria in which quinin fails to cure: King recounts the fact that in these cases the parasite remains hidden in the dark recesses of the body where the fluorescent property of quinin cannot come into play. In these cases sporulation occurs very irregularly, probably because the crescents do not secure sufficient light to sporulate simultaneously in sufficient numbers to generate regular paroxysms. He explains the paroxysms of ordinary ague as the result of sporulation of a number of parasites contained in red corpuscles which are so swollen as to be arrested in the capillaries of the skin, thus exposing the parasites to the light of the sun, the subsequent changes in the skin favoring the repetition of this process. This theory is ingenious and interesting. One obscure point in the exposition concerns the cause of the diminution of the normal fluorescence by malaria. No explanation is offered in regard thereto. Furthermore, it seems a little difficult to account for the regularity of the paroxysms by this theory. The reactions of the malarial parasite to various forms of light certainly seem important enough to merit further study.

#### ICE PURIFIED IN THE MAKING.

The old idea that ice is purified frozen water receives considerable substantiation through recent investigations. Researches on this subject which were begun in 1888-89 under the direction of the Massachusetts State Board of Health<sup>1</sup> and concluded in 1899-1900, demonstrate the mechanical influence of crystallization in purifying water. Experiments in the physics of freezing natural or artificial ice show the tendency which there is for substances in either solution or suspension in the water to be thrown out of the forming ice. So far as bacteria are concerned it seems these researches show that when the freezing begins at the top, as in the case of winter ice, and does not go to the bottom 90 per cent. and upwards of the bacteria are eliminated. But in ice which includes all of the water, as in shallow pools or in artificial ice, all of the bacteria present are, of course, necessarily included. This agrees with the well-known trick of those ice manufacturers who use impure water and then tap the center of each block before complete

consolidation in order to draw off that portion of the water in which the impurities are perceptibly concentrated. In commenting on these valuable researches H. W. Hill<sup>2</sup> calls attention to two other factors which, by the work of Winslow and Park, are proved to tend strongly towards the purity of ice. First, typhoid bacilli, the most dreaded bacteria of water supplies, are destroyed to the extent of 90 per cent. by a temperature of a little above 0 C, a temperature which water passes through just before it freezes, and then, second, in ice itself some 90 per cent. of any typhoid bacilli included die out during the first 24 hours. In a longer time even a greater purification occurs. By reason of all these factors being at work it is claimed that given 1,000,000 typhoid bacilli in a certain quantity of water, all but 100,000 would be expelled by the mechanical process of crystallizing that water, of the remaining all but 10,000 would be killed at the special temperature mentioned, and, finally, only 1,000 would survive a sojourn of 24 hours in the ice itself. This amounts to a purification of 99.9 per cent.—an extremely successful filtration. We may conclude from all this that natural ice properly cut so as to avoid the uppermost layer, which is often impure from matter originally floating on the water and by later accretions from above or by flooding from below, is comparatively innocuous. Particularly at this season of the year it is decidedly comforting to be assured on competent authority that infection through ice is not much to be dreaded.

#### THE EYESIGHT OF CHILDREN.

Comment has often been made, much more so in the past than now, on the large number of persons in American cities, including even many children, who wear glasses, and it has been suggested that this state of affairs is the expression of a fad or of a bit of affectation or of avarice on the part of the oculist. The fact is, however, that as a result of our indoor habits, demanding constant use of the eyes at short range, ocular defects that would otherwise cause no trouble and thus remain concealed become manifest as eyestrain in one form or other. To the credit of American ophthalmologists be it said that they were among the first to appreciate the significance of such eyestrain, and to the correction of its causes they have given most assiduous, intelligent and successful attention. We think it may be stated without fear of contradiction that no better refractive work—including muscle-equilibration—is done than that of the ophthalmologists of the United States. As a result of observations made upon children in the public schools the relatively large preponderance of ocular defects has been amply demonstrated and some investigations made by a competent Swiss oculist<sup>1</sup> tend to show that similar conditions exist among the school-children of continental Europe. In the course of examinations into the eyesight of 19,947 children in the public schools of Zurich during the eight years from 1884 to 1902 defective vision was found in 19.1 per cent. of this number, in the following percentages: hyperopia, 1.2; myopia, 0.9; astigmatism, 8.6; spasm of the ciliary muscle, 1.4; strabismus and amblyopia, each 1; corneal

1. Thirty-second Annual Report, 1901.

1. Adolph Steiger: Lancet, May 3, 1902, p. 1287.

maculæ, 1.3, and various other defects 1.5. It is uncertain from the accessible report whether a cycloplegic was employed invariably or at all in making the examinations, but the statement that an exact ophthalmometric examination of eyes with defective vision was an absolute necessity for the detection of the large number of cases of astigmatism suggests at least that paralysis of the ciliary muscle was not induced as a rule. It seems also that only those children may have been examined who complained of defective vision or apparently had impaired eyesight. In accordance with the results of the examination, written instructions were given in the case of each child, defining the distance of the seat from the window and from the blackboard, the use of spectacles, etc. The parents were informed when the eyesight was defective and were referred to an ophthalmologist for treatment. The Germans certainly deserve credit for valuable contributions to both the theory of optics and the practical application of optical principles, but they have been slow to make such application to the measurement and adjustment of glasses for the correction of errors of refraction.

## Medical News.

### DISTRICT OF COLUMBIA.

**The New Surgeon-General.**—Colonel William H. Forwood, assistant surgeon-general, United States Army, has succeeded Dr. George M. Sternberg as surgeon-general.

**Surgeon-General Sternberg's Retirement.**—After forty-one years of service in the Army Dr. George M. Sternberg retired, June 8, with the rank of brigadier-general.

**University of Georgetown Commencement.**—On May 29, the fifty-third annual commencement exercises of the medical department were held, a class of 13 receiving diplomas from Rev. Jerome Daugherty, S. J., president of the University. Colonel Charles Smart, assistant surgeon-general, U. S. Army, delivered the Toner address, and Dr. Joseph A. S. Regli was valedictorian.

**Marine-Hospital Positions.**—A board of officers will meet at the Marine-Hospital Bureau, Washington, D. C., June 16, to examine candidates for admission to the grade of assistant-surgeon in the U. S. Marine-Hospital Service. Candidates must be between 21 and 30 years of age, graduates of a reputable medical college, and must furnish testimonials from responsible persons as to character.

**Public Health and Marine-Hospital Service.**—The Senate bill to increase the efficiency of the Marine-Hospital Service by making it the Public Health and Marine Hospital Service, has been favorably reported by the House Committee on Commerce. It continues the present service with the changes of title and with functions pertaining to public health, as well as to marine hospitals. In time of war authority is given the President to utilize the service for military purposes. Provision also is made for co-operation between the Federal and State health and quarantine authorities by means of conferences.

### ILLINOIS.

#### Chicago.

**Dr. Gehrman Resigns.**—After an honorable service of ten years, Dr. Adolph Gehrman, director of the laboratory of the Chicago Department of Health, has resigned and will take complete charge of the bacteriologic and hygienic departments of the Columbus Medical Laboratory.

**Students Object to Convocation.**—At a recent meeting of the senior class of Rush Medical College, the members objected to the order providing that they receive their diplomas with the academic students at the general convocation, and decided that they preferred a special graduation for the medical department.

**Iowa College Alumni Meet.**—At the meeting of the Chicago Association of Alumni of the Iowa State Agricultural College, held at the Sherman House, June 6, physicians were

much in evidence. Dr. William E. Gamble, president, acted as toastmaster, and Drs. Elbert C. Fortner and Burton Rogers responded to toasts.

**Alumni Week at Northwestern.**—For the week from June 16 to 21, the alumni committee of Northwestern Medical School has arranged a schedule of clinics, and the wives of the alumni are tendered receptions on four afternoons. The alumni banquet will be held at the Auditorium, June 17, the thirty-sixth annual meeting of the alumni association in Davis Hall, June 18, and the commencement exercises at the Auditorium, June 19.

**Increased Death Rate.**—An increase of the death rate, amounting to a little more than 11 per cent. over that of the previous week and of about 10 per cent. over that of the corresponding week of last year, is noted in the returns to the registrar of vital statistics, for the week ended June 7, the total, 472 deaths, being forty-nine and fifty-nine, respectively, in excess. The increase is entirely in the ages at the extremes of life, under 1 year and over 60 years of age, at which periods the sudden alternations of temperature produce the most untoward effects.

**The Effect of the Drainage Canal.**—"What may be expected for the betterment of the public health when the sanitary drainage channel is in full operation and the intercepting sewers are completed has been gratifyingly foreshadowed during the last few weeks," says the report of the commissioner of health. "Contrary to past experience—that is prior to the diversion of the Twelfth and Twenty-second street sewers in 1898, by which all sewage north of Thirty-fifth street to the main river is excluded from the lake—the heavy rains of May failed to affect the sanitary quality of the public water supply to any material extent and there has been no such increase of the impure water diseases as uniformly followed such rains in the past. A most reassuring experience was that of the closing of the dam at Lockport on June 3, on account of the cloudburst at Joliet and vicinity. Although the current of the river was thereby turned back into the lake for several hours, at the rate of some 250,000 to 270,000 cubic feet per minute, the water from all tunnels remained pure until Saturday. This unhopèd-for result dispelled the apprehension felt by the earlier promoters of the drainage channel lest a reversal of the current from any cause, but especially from heavy rains, should result in a pollution of the water supply. It is now seen that the continuous current scours the river bottom, so that there is little or no accumulation of sewage or sewage deposits wherever the current reaches. The pollution that now occurs from time to time is due entirely to the sewage from the lake emptying sewers flushed out by heavy rains."

### MARYLAND.

#### Baltimore.

**Mortality for the Week.**—There were 185 deaths for the week ended June 7, consumption leading with 34.

**Fellowships at Johns Hopkins.**—The following have been appointed fellows at the Johns Hopkins University for the next year: Ernest G. Martin, Ph.B., St. Paul, Minn., Hamlin University, 1897, physiology; Roy McLean Van Wart, Montreal, Canada, A.B. University of New Brunswick, 1898, pathology, and the Adam T. Bruce fellowship in biology has been awarded to Mr. Reinart Parker Cowles, Los Angeles, Cal.

**The Quarter Club** reports \$2294 collected toward the Sanatorium for Consumptives. The club was founded, February 14, with the purpose of establishing in the Blue Ridge Mountains a modern sanatorium for the treatment of tuberculosis. Many of the churches have helped the cause, especially the synagogues. The money raised will be placed in the hands of the commission on tuberculosis which is to be appointed by the Governor.

**Personal.**—Dr. Henry H. Flood, physician to steamers, left for New York, June 4, to sail for Norway.—C. E. Brush, Jr., student in the Johns Hopkins University Medical School, will be a member of the biological party sent by the New York University to White's Island, in Hamilton Harbor, Bermuda, for the study of marine fauna this summer.—Dr. Robert A. Ravenscroft, Accident, Garrett County, has been nominated by the President as surveyor of the Port of Baltimore.—Dr. William Osler has entirely recovered his health. He will not go abroad as usual this summer, but will spend the summer in Canada.

**Public Baths.**—The public baths inaugurated through the liberality of a wealthy citizen, Mr. Henry Walters, have proven a great success. At Bath No. 1, which has been in operation

two years, the attendance increased from 69,774 monthly the first year to 87,000 the second year. Several days this year already 1000 bathers have been accommodated and many have been turned away. The commissioners are considering an increase in size of this bathhouse. Each adult is charged three cents for towel and soap and each child 1 cent. The receipts from this source at Bath No. 1 in two years were \$5000. The two bathhouses are open the year round, and Mr. Walters has offered to erect a third. The three outdoor baths are now in good shape for the hot weather. An outdoor bath for women and girls on the water front is also contemplated.

#### MICHIGAN.

**Grand Rapids Medical College** graduated a class of 17, June 2.

**New Hospitals.**—Lockwood Hospital, Petoskey, will be opened for patients soon after July 1.—A site has been secured for a modern hospital in Negaunee.

**Cornerstone of New Battle Creek Sanitarium Laid.**—The cornerstone of the new sanitarium at Battle Creek was laid with appropriate ceremonies, May 11. The new building will, it is said, be the largest sanitarium in the world. It will be 550 feet long, five stories high, and is to be made as nearly fireproof as modern science can make it. The contractors have promised to have it completed October 1.

**Malpractice Suits Fail.**—In the damage suit for \$10,000, brought by George R. Steele, Mt. Clemens, as executor of his deceased wife's estate, against Drs. Henry G. Berry and Harry F. Taylor of Mount Clemens and Dr. Angus McLean of Detroit, Judge Tucker ordered a non-suit, May 22.—Judge Law of Port Huron summarily terminated the suit of Robert Bartell of Capac against Dr. Ephraim J. Buck for \$10,000 on account of alleged malpractice on the grounds that the plaintiff had not made out his case.

#### NEW YORK.

**New City Hospital at Ogdensburg.**—The new city hospital at Ogdensburg was consecrated, May 27, and Mayor George Hall, who contributed \$20,000 toward its erection, delivered the keys of the institution to Bishop Gabriels.

**Persons.**—Dr. Allen A. Jones and wife, Buffalo, will spend two months in travel abroad.—Dr. Max C. Breuer, Buffalo, sails for Europe in a few days and will spend three months in post-graduate study at Breslau.—Dr. James H. Burtenshaw, New York, has been appointed adjunct professor of gynecology at the New York Polyclinic Medical School and Hospital.

**Registration of Nurses.**—The recently-organized New York State Nurses' Association is considering the question of registration which will ultimately place training schools for nurses under the supervision of the Board of Regents, the idea of the registration being the protection of the public against impostors and a raising of the standard of the various training schools.

#### New York City.

**The New York Ophthalmic and Aural Institute**, under charge of Dr. Herman Knapp, is to move from its old quarters in East Twelfth Street to a new edifice on Central Park West and Sixty-fourth Street.

**Cornell Medical Graduates.**—At Carnegie Hall on June 4, 42 men and 9 women received diplomas from President J. G. Schurman, of Cornell University. This was the first class to take the full course in medicine under Cornell auspices. The address to the class was made by Dr. T. Gaillard Thomas.

**The Summer's Work Among the Poor.**—Dr. Herman M. Biggs, chief medical officer of the Department of Health, has submitted a report of the work of the summer corps of physicians, who attend the sick in the crowded tenement districts during the summer season, and a prospectus of the work planned for this year. It is proposed to increase the number of physicians from 42 to 75, and to begin the work about June 15, instead of July 1, as heretofore. To meet the extra expense this will necessitate Health Commissioner Lederle has asked the Board of Estimate for a special appropriation of \$10,000, in addition to the \$10,000 provided by the legislature for the Borough of Manhattan and \$5000 for Brooklyn. It is proposed to extend the work of the summer corps this year to include vaccination in the tenement houses and measures for the prevention of malarial fever, which Dr. Biggs says is increasing steadily in Manhattan and Brooklyn despite the fact that it is distinctly a preventable disease.

#### PENNSYLVANIA.

##### Philadelphia.

**For Jewish Hospital Nurses.**—Mrs. Sarah Eisner has offered to donate a sum not exceeding \$20,000 for the purpose of erecting and furnishing a suitable building, to be known as the "Elsner Building for Nurses."

**Hospital Beneficiaries.**—The will of Valentin Geng, of Upper Darby township, Delaware County, probated at Media, June 3, bequeaths \$36,000 to charity. The hospitals which are beneficiaries are: St. Mary's Hospital, Philadelphia; Presbyterian Hospital, Philadelphia; German Hospital, Philadelphia, and Jewish Hospital, Ogontz, \$5000 each, and the Chester Hospital \$1000.

**New Chair of Clinical Medicine.**—Drs. Julius L. Salinger and Thomas G. Ashton have been elected to the new chair of clinical medicine established by the Board of Trustees of the Jefferson Medical College. The new chair is in reality a split-off from the former professorship of theory and practice of medicine held by Professor James C. Wilson. Dr. Wilson will become professor of medicine under the new arrangement, which becomes effective when the college year opens, next October.

#### GENERAL.

**Cholera in Manila** continues to be reported at the rate of three to ten cases a day. The natives cause great trouble by concealing cases of sickness.

**Naval School Goes to Washington.**—The medical school at the Brooklyn Navy Yard has been ordered transferred to Washington, D. C., in accord with the plan of the government to make the latter city the home of Federal education. Rear Admiral Rixey, surgeon general of the navy, said that the Navy Department proposed to assign to this school immediately after appointment every young medical officer who enters the service. He will there be grounded in the rudiments of his work as a naval officer and will also be given an opportunity to complete his professional education. Older medical officers will eventually be assigned to the school, but this can only be done when an increase of the corps is granted by Congress. One of the great advantages to follow the establishment of the school in Washington is that it will enable officers to attend the lectures given by army officers at the Army Medical College and those given by experts of the Department of Agriculture.

#### Smallpox.

**Illinois:** During May smallpox was reported in 33 counties and in 55 localities.

**Chicago:** Twenty new cases of smallpox were discovered during the week ended June 7, of which number 12 were colored persons, and at the close of the week there were 55 cases under treatment in the Isolation Hospital, 14 having been discharged. Of those now in the hospital 24 are white and 34 are colored, a proportion of 44 per cent. of the former and 56 per cent. of the latter. And yet the colored form only 1.3 per cent. of the total population. Not one of the colored persons showed any sign of having ever been vaccinated, and among the whites only one, who had a faint scar, forty years old.

**Maryland:** The State Board of Health has been formally notified of the prevalence of smallpox in Williamsburg, Dorchester County. The postmaster and station-master are both down with the disease. No mail will be delivered and no trains will stop there, so that the town is practically cut off from the world. The health officer of the county, Dr. Steele, diagnosed the disease as genuine smallpox, though of a mild grade.

**New York:** Twenty-five cases of smallpox have developed in Gowanda, N. Y., and it is feared two of those afflicted will die. A case of what was supposed to be chicken-pox developed in the family of Adelbert Stage. It was later diagnosed as smallpox. Members of the family have been in attendance at the public schools, exposing every pupil. Schools, churches and the theater have been closed. There are at present about 30 cases in Hope Hospital, Rochester. "During the last five years and including the present outbreak we have had but three patients who had ever been vaccinated," says Dr. George W. Goler, health officer. "At the hospital now there is but one patient that has been vaccinated and that one is a woman 30 years old who was vaccinated when an infant and has not been vaccinated since."

**Puerto Rico:** The epidemic of varioloid at Arecibo is now well under control. Several weeks ago there were 150 cases and now the medical officers report that there are only about 50.

#### FOREIGN.

**Yellow Fever in Mexico.**—An epidemic of yellow fever of a virulent type has broken out at Vera Cruz.

**Victim of Plague.**—Dr. Wray, L.R.C.P. and L.R.C.S. Edin., 1870, who was government medical officer of Brisbane, Australia, died from plague, May 9.

**Exposition of Appliances Used in Medical Instruction.**—Berlin is holding an exhibition of aids and appliances for the instruction of medical students.

**Another Charlatan Fined in Germany.**—The courts at Zittau condemned to a fine of 100 marks and costs, the manufacturers of an emulsion that was claimed to be a cure for tuberculosis.

**Deaths Abroad.**—Dr. K. F. Skrzeczka, Geheimer Ober-Med.-Rath, at Steglitz, May 20.—T. v. Kazmarsky, professor of gynecology at Budapest.—L. Seeretan, professor of internal medicine at Lausanne.

**Tuberculosis Sanatorium in Australia.**—The foundation-stone of the new convalescent home for consumptives at Northwood, N. S. W., was laid, May 13. The home will have 100 beds. The funds are from an anonymous gift of \$500,000.

**Personal.**—Dr. Herman Bryan, who has been resident physician at the Chester (Pa.) Hospital for the past year, will sail, June 21, for China, to assume charge of the hospital of the Presbyterian board of missions at Hai Nan, south of Hong Kong.

**Hospital Collection in Sydney.**—An annual event in Sydney is the collection taken for the hospitals, the entire city being canvassed by the women. The government gives an amount equal to the total sum raised. The collection this year on May 3 was nearly \$20,000.

**Seegen Prize for Biologic Research.**—Professor J. Seegen has given 5100 marks to the Vienna Academy of Sciences, to be awarded as a prize for the best work on the problem whether a portion of the nitrogen of the albuminates in the organism is excreted in gaseous form through the lungs or the skin. The competing articles must be in German or French and be received by the Academy before February 1, 1904.

**Is a Child Viable that Lived Twenty-five Days?**—The French laws of inheritance through the offspring are involved in a case at present in the courts. After a pregnancy of six and one-half months, the mother died during childbirth and the child died after remaining alive twenty-five days in the incubator. The mother's dowry returns to her family if the child was not viable. Otherwise, it is shared by the husband.

**Physician Awarded Damages.**—The Belgian courts recently awarded \$100 damages to a physician of Dijon who had been assaulted in his office and bitten in the thumb by a young man whom he knew to be syphilitic. He sued for \$20,000. The medical experts testified that the young man was not in the contagious stage of syphilis, and the court awarded damages for merely the time lost by the physician, who refrained from practicing until the experts had examined the young man.

**Death of Kussmaul.**—Germany celebrated, on February 20, the eightieth birthday of Adolf Kussmaul and now the cable brings us the news of his death. He was professor at Heidelberg, Freiburg and Strassburg in turn, and after the age limit had been extended in order to keep him, finally retired to Heidelberg. He was the son of a physician and spent many years in his youth in practical research in pathologic anatomy which laid the foundation for unusual achievements in later life. His explanation of the essence of the epileptic seizure is one of the corner-stones of our present knowledge and his work on "Disturbances in Speech" forms part of von Ziemssen's "Manual of Special Pathology." His studies of tetanus and bulbar paralysis, congenital anomalies of the uterus, paracentesis in pleuritis, periarteritis nodosa, diabetic coma and embolism of the mesenteric artery are well-known works, but his widest fame rests on his research on the stomach functions and his introduction of the stomach pump as a means of treating dilatation of this organ. The stomach pump opened a new era for the study not only of the pathology but of the physiology of the stomach. One of his most important contributions to science is his famous article, "die peristaltische Unruhe des Magens, das Platicheräusch und Galle im Magen." He published not long ago a fascinating book of reminiscences, "Memories of the Youth of an Old Doctor." His only son died before him.

#### LONDON LETTER.

##### The Smallpox Epidemic.

The number of cases of smallpox in the metropolitan hospitals, which had been 1515, 1442, 1419 and 1360 in the four preceding weeks, further declined this week to 1344; 307 new

cases were admitted during the week against 250, 248 and 233 in the three preceding weeks.

#### Vital Statistics in 1900. Lowest Birth Rate on Record.

The annual report of the Registrar General on England and Wales has just been issued. The births numbered 927,062, equal to an annual rate of 28.7 per 1000—the lowest on record since the establishment of civil registration in 1837. The rate is 1.3 below the average rate in the ten years 1890-1899. The decline in the birth rate has been continuous since 1895, when it was 30.2 per 1000. The death rate was 18.2 per 1000 against 17.4, 17.5 and 18.2 in the three preceding years; the mean rate in the ten years 1890-1899 was 18.3. The proportion of deaths of infants under one year to registered births was 154 per 1000 against an average of 153 in the ten preceding years. The mortality from alcoholism was 132 per million among males and 95 among females, both of which are the highest rates recorded. The mortality from cancer has continuously increased in recent years; in 1900 it was 16 per cent. in males, and 10 per cent. in females in excess of the decennial average, and in each case exceeded the highest previously recorded. The mortality from pulmonary tuberculosis was considerably lower than in the preceding ten years, the decrease amounting to 2 per cent. among males and 12 per cent. among females. A very curious fact is that a marked decline in the marriages of widowers and widows has been in progress for the last thirty years. In 1871-75, of 1000 marriages 138 were of widowers and 100 of widows; in the successive quinquennial periods the numbers are respectively 136 and 98, 126 and 89, 119 and 83, 112 and 79; in the year 1900 the decrease is greatly accentuated, the numbers being 94 and 68.

#### Labor Casualties.

The annual report of the Chief Inspector of Factories and Workshops for 1901, which is just issued, forms a most interesting and valuable record of the casualties of peace, which during the year amounted to 83,760. Fatal accidents were fewer than in 1900, amounting to 1035 against 1045. This is the first interruption of the increase which has gone on year by year from 455 in 1895 to 1045 in 1900. The report shows, with certain reservations, continued improvement in the methods of fencing machinery. There were several serious explosions, the most disastrous being that of spirit vapor in the drying stove of a felt hat works whereby 14 lives were lost. Continued advance has been made in securing means of escape in case of fire. A satisfactory decrease in lead poisoning is recorded, which is mainly due to improvement in two trades—white lead and pottery. But in certain branches of manufacture, particularly in the making of electric accumulators, there has been a marked increase of plumbism.

#### Plague in Sydney.

According to a telegram of May 24 there have been 126 cases of plague in Sydney and 33 deaths. Fifty-three cases have been cured and there are 40 in hospital. Rats seem to have been the source. A plague-infected rat was found in a block in which no case had occurred. It is feared that a large number of infected rats are at large. The disease has attacked the animals in the Zoological Gardens. In April, 21 quadrupeds and some birds died suddenly. It has been proved that the majority of the marsupials died of plague; the cause of death of the other animals is not known. The gardens are near the principal garbage tip whence the rats come.

#### Abstaining Doctors.

The British Medical Temperance Association, which has just met in annual congress, bears witness to the gradual increase of medical abstainers. According to the twenty-sixth annual report there are in England and Wales 307 members and 120 student associates. Several leading physiologists have been gained by the association. In conjunction with the American Medical Temperance Association the British association intends to publish a manifesto declaring that experiments have proved that even a small quantity of alcohol prevents perfect mental action and interferes with the tissues and cells, and that a moderate quantity taken for a number of years produces gradual deterioration of the tissues and hastens senile changes.

#### The Etiology of Leprosy. Commensal Communication.

At the Royal Medical and Chirurgical Society Mr. Jonathan Hutchinson made a communication on this subject based on the experiences gained in his recent tour in South Africa. A preliminary notice of his views has already been given (THE JOURNAL, April 26, p. 1091). Among other conclusions Mr. Hutchinson has arrived at the following: 1. Leprosy was al-

most if not absolutely unknown in South Africa before the Dutch occupation of the Cape and their introduction of Malays from Java to establish a fish factory at Capetown. 2. Salt fish and rice was the staple food of the Dutch farmers and their Hottentot slaves at the time leprosy was first observed, in 1756. The disease first spread around Capetown, then over South Africa. 3. Leprosy prevails very slightly in towns (unlike highly-infectious maladies) but affects chiefly agricultural laborers. Though widely spread, the disease is unequally distributed—dotted about among the mining and agricultural population of Cape Colony, who use very largely badly-cured salt fish. 4. In the Kaffir kraals of Natal the disease is communicated from person to person by eating food from a leper's hands contaminated by food containing the bacillus. The disease is not contagious in the ordinary sense of the term, but only in this special manner, which Mr. Hutchinson proposes to call "commensal communication." He thinks that the two hypotheses of fish production and commensal communication together explain the difficulties hitherto felt in regard to leprosy, such as its not spreading in civilized communities, its irregularity and uncertainty even among the most careless, the frequency with which young children suffered, the universal but varying disproportion of the sexes, and the scattered distribution without, as in South Africa, any foci of great prevalence. The facts in favor of the view that the bacillus is received through the stomach are very strong. The first symptoms are those of a blood disease. There is never a primary sore or other indication of local infection. The earliest phenomena, whether of the skin or nervous system, are, as a rule, bilateral and imply blood communication. It is impossible to believe in communication by the breath, for attendants in leper houses and others in constant and close communication with lepers never take the disease. Similarly, contagion through the skin is incredible. Husband and wife rarely suffer together; many inoculation experiments have failed. Such contamination of food as described could only occur under conditions of extreme carelessness in feeding. Hence, among the cleanly communities of Europe and America, the disease was not communicated.

## Correspondence.

### The Prevalence of the Individual Communion Cup.

PHILADELPHIA, June 6, 1902.

*To the Editor:*—Your recent editorial reference to the encouraging progress in the adoption of individual communion cups, among other things pertaining to church hygiene, prompts me to submit the following figures, which give an approximation of the status of the movement nearly to date:

About 1500 churches, representing nearly 600,000 communicants, are now using individual cups, and would not revert to the commonly-used cup. About 70 per cent. of these churches are of the Baptist, Congregational and Presbyterian denominations, and nearly equally distributed among these three. The Christian (Disciples), Lutheran, Methodist and Reformed churches follow in about equal proportion. There are a few Protestant Episcopal, Universalist, Swedenborgian, and other scattered denominations using the cups.

Almost three times as many churches now use individual cups as compared with 1898. The reform began in 1894, when hardly a score of churches were using them. By far the greatest proportion of churches are in New York, Pennsylvania, and the New England states. However, the states of the middle west are rapidly increasing in the number of these churches, while Colorado and California have many in the list. It may be interesting to note that one or more churches have made the change even in Mexico, Porto Rico, the Sandwich Islands, Japan, Burma and New Zealand.

It is extremely rare that any antagonistic official action is taken by ostensibly representative ecclesiastic bodies, the matter usually being left to each local church to investigate and decide. The only opposition that has come to my notice for many years was lately that of the Lutheran ministerium meeting at Easton, Pa., at which its action of 1895 was reaffirmed, condemning the use of individual cups, apparently for dogmatic and ritualistic, certainly not for cleanly or sanitary reasons. The Church of England is taking more than transitory interest in the matter of a sanitary administration of

the communion, as witnessed by the church papers and the *London Lancet*, and the suggestions regarding the revival of the ancient custom of intinction, or of each communicant dipping a piece of bread into the wine. Very truly yours,

HOWARD S. ANDERS, M.D.

### A Voluntary National Examining Board.

ORANGEBURG, S. C., June 3, 1902.

*To the Editor:*—It strikes me that the idea of a Voluntary National Board of Medical Examiners would be feasible. There might be a central examining board at Washington, consisting of leaders in the profession, while there could be subsidiary boards holding their meeting in various geographical centers of the country, say at New York, Chicago, Atlanta, St. Louis and Denver. These subsidiary boards (as well as the central board at Washington if desirable) could be elected by the National Confederation of State Medical Examining and Licensing Boards, and should consist of members of the state examining boards or men suggested by said boards—one for each state in each subsidiary district. The central board at Washington could be elected by the American Medical Association or the Confederation from recognized professional leaders. Under this arrangement the local or state boards could recognize the certificates of the central or subsidiary boards, and if not legally now, could soon secure such amendments in each state to render such recognition permissible. I believe some such arrangement as this to be entirely feasible and the solution of the whole matter.

WILLIAM R. LOWMAN, A.M., M.D.

### An Addition to Dr. Montgomery's Article.

CHICAGO, June 6, 1902.

*To the Editor:*—Will you do me the favor to publish the two following foot-notes, which by mistake were omitted from the article on Cutaneous Blastomycosis published in the last issue of THE JOURNAL:

"In photographing cultures, Tube 18 (Fig. 32) was accidentally substituted for an almost identical growth on glycerin agar, the plan being to show the variations of the organism on the same medium. The mistake was not discovered in time to secure a new cut."

"Figs. 17, 19, 26, 28, 29 and Figs. 36 to 41 are from sections and cultures prepared by a former assistant, Dr. H. T. Ricketts, from our Cases 3, 4, 5, and 8, on which cases he did most of the laboratory work for us."

Case 12 should have a reference to the foot-note appended to Case 13. Very truly yours,

FRANK HUGH MONTGOMERY.

## Miscellany.

**Dysentery.**—The *Cleveland Medical Journal* comments on the researches of Simon Flexner and his students, which, he says, have proved beyond doubt that "the acute American dysentery is identical with the corresponding disease of other temperate regions and of the tropics, and is caused by the same micro-organism." Flexner holds out strong and immediate hope that as a result of these studies there will shortly be presented to the world a well-tested and curative serum that will protect against the disease and mitigate an attack. He goes further and hints that Vedder and Duval have produced such a serum which now only awaits thorough trial before being finally announced. As dysentery is one of the most widespread of diseases and as, especially in hot climes, it is the direct cause of a great number of deaths, this discovery, if finally confirmed, will be of an amount of good to mankind that will hardly be second to that which has come from the discovery of vaccine and of diphtheria antitoxin. "Thus the specters pass."

**The Principles of the American Medical Association.**—Nations, governments and societies owe their stability, strength and progress to the association of individuals whose aims are

worthy, whose aspirations are high, whose designs are wise and whose purposes are steadfast, who thus may hope to reach the goal of their ambition and win the object of such organization. How does the American Medical Association respond to this test? 1. Worthy aims: The union of all the members of our noble profession of every state and territory in a representative society for the scientific study of all that relates to our profession, the public welfare and the nation's good, as well as the cultivation of social good-fellowship. 2. High aspirations: The attainment of the highest ideals in medical education and practice, and the application of the golden rule in dealing the one with the other. 3. Wise designs: The presentation at the annual meeting and through the columns of THE JOURNAL, free from all sectarian narrowness, of the results of individual efforts and the latest progress in our arts. 4. Steadfast purposes: The indefatigable pursuit during the past fifty-four years of these ennobling precepts has added constantly to our numbers and influence, and advanced our knowledge and the scientific character of our work, which is studied and assimilated by our brethren throughout the world.—*N. Y. State Jour. of Medicine*.

### Married.

F. GOODWIN DU BOSE, M.D., to Miss Aimee Nelson, both of Selma, Ala., June 11.

CARL ANSON CLEMONS, M.D., to Miss Marie Gunther, both of New York City, June 4.

J. CHESTON KING, M.D., Atlanta, Ga., to Miss Mary Barr of Homewood, Ala., June 5.

FRED J. HART, M.D., Barrie, Ont., to Miss Nellie Bain of Winnipeg, Manitoba, June 4.

WILLIAM D. INGLIS, M.D., Claysville, Pa., to Miss Alice Cockins of Canonsburg, Pa.

R. W. JONES, M.D., Wausaukee, Wis., to Miss Helen Worthington, of El Paso, Ill., June 4.

DANIEL J. HEALY, M.D., Lexington, Ky., to Dr. Louise Bergman of Louisville, Ky., June 15.

JOSEPH LYON MILLER, M.D., Thomas, W. Va., to Miss Pamela Doreas Hampton, at Ashland, Ky., June 3.

### Deaths and Obituaries.

#### Joseph Eastman, M.D.

"In the death of Dr. Eastman, June 5, the community loses a surgeon of renown and a citizen of prominence. His life was a life filled with constant work and bearing the fruits of such work in things accomplished and good done. He won the respect and esteem of his day and generation, the love and affection of all that knew him well. The end coming still in the prime of life might seem untimely, but no life ends untimely that has been filled with devotion to duty."

The medical profession of the United States will unite in endorsing the eulogy of Dr. Eastman with which this notice begins. His services to medicine and surgery, and especially abdominal surgery, were inestimable, and his personal qualities were such as to make him beloved of all who knew him.

Joseph Eastman was born in Fulton County, N. Y., January 29, 1842. At the outbreak of the Civil war he enlisted in the Seventy-seventh New York Volunteer Infantry, and after an attack of typhoid fever was put on light duty at Mount Pleasant Hospital, Washington, D. C. Here he showed such ability as a nurse that he was appointed hospital steward in the army. During his service of three years he attended medical lectures at the University of Georgetown, was graduated in 1865, and at once passed the examination for the Army and was commissioned assistant surgeon of volunteers. In this capacity he served until mustered out in May, 1866.

He settled in Brownsburg, Ind., and practiced there for seven years, during which time he attended lectures in Bellevue Hospital Medical College, New York, from which he was graduated in 1871. Four years later he was made demonstrator of anatomy in the College of Physicians and Surgeons, Indianapolis, and moved to that city. For nine years he was consulting surgeon to the Indianapolis City Hospital, and for eight years thereafter, assistant to Dr. Theophilus Parvin.

In 1879 Dr. Eastman was one of the organizers of the Central College of Physicians and Surgeons, Indianapolis, and accepted the chair of anatomy and clinical surgery. After having taught anatomy in both colleges for seven years, a special chair was established in the Central College of Physicians and Surgeons—that of diseases of women and abdominal surgery—which he held up to the time of his death. For several years he was president of this college. After 1886 he limited his practice to diseases of women and abdominal surgery.

He was a frequent contributor to medical literature. In 1890 he was a delegate to the International Medical Congress at Berlin, and in 1893 was chairman of the Section of Diseases of Women in the American Medical Association at its Milwaukee meeting. He had been a member of this association since 1872, and from 1894 to 1900 was a member of its board of trustees.

About a year ago Dr. Eastman became ill and the disease was eventually diagnosed as malignant disease of the liver. Nothing could be done to stay the progress of the disease, and he died, June 5, at the age of 60.

JOSEPH EASTMAN, M.D.

His funeral was held, June 8, under the charge of George H. Thomas Post, G. A. R., of which Dr. Eastman was a member. The Marion County Medical Society held a special session, May 6, at which memorial addresses were made by Drs. G. W. H. Kemper and George R. Greene, both of Muncie; Dr. Barnett Wallace of Franklin, and Indianapolis physicians. At a meeting of the faculty and alumni of the Central College of Physicians and Surgeons, presided over by Dr. John T. Scott, the following resolutions were adopted:

"Resolved, That the faculty and alumni of the Central College of Physicians and Surgeons have met with an inexpressible loss in the death of Dr. Joseph Eastman, who was not only the father of the institution, but the most beloved and respected teacher and friend of all its students. His unequalled skill as a surgeon, his able lectures, his world-wide reputation, his lofty character, his wonderful success achieved by his own efforts and indomitable courage in spite of great obstacles have been a large part of the glory of this college in the past and will be an inspiration in the future."

William G. Bibb, M.D., Vanderbilt University, Nashville, Tenn., 1877; Bellevue Hospital Medical College, New York, 1878, one of the foremost physicians of Alabama, died at his home in Montgomery, May 31, from paralysis, after a long

illness, aged 48. He practiced in Montgomery until 1881, when he was elected professor of materia medica and therapeutics in the Medical Department of the University of Tennessee, Nashville, and removed to that city. In 1897 he was particularly active in combating yellow fever, and never recovered from the effects of his exhaustion. In 1899 he was stricken with paralysis. He was a member of the Montgomery County Medical and Surgical Society, which adopted resolutions of respect, sorrow and sympathy.

**Dallas Bache, M.D.** Jefferson Medical College, Philadelphia, 1860, colonel and assistant surgeon general, U. S. Army, retired, died at his home in San Diego, Cal., June 2. He entered the army as assistant surgeon in 1861 and served in the field during the entire Civil war. After the war he was stationed for a time in San Francisco, and for a number of years was the chief surgeon of the Department of the Platte, with headquarters at Omaha. Later he was stationed at Washington as assistant surgeon general. He remained on duty there until his health failed, and then went to San Diego. He was a member of the Association of Military Surgeons of the United States.

**Edwin V. Spencer, M.D.** Western Reserve University, Cleveland, Ohio, 1851, an old and beloved physician of Mount Vernon, Ind., died at his home in that place, May 28, from angina pectoris, aged 77. He first located at Beaver Dam, Pa., but in 1857 moved to Mt. Vernon, Ind., where he practiced continuously until his last illness. He was a member of the American Medical Association.

**Cloyes W. Gleason, M.D.** University of Pennsylvania, Philadelphia, 1844, died at his home in Philadelphia, May 30, aged 81 years. He was the first professor of anatomy and physiology at the Woman's Medical College of Pennsylvania, and had practiced in Philadelphia for 35 years, until his retirement in 1897.

**Thomas F. Corson, M.D.** University of Pennsylvania, Philadelphia, an assistant surgeon in the Civil war, who served with the Sixty-seventh Pennsylvania Volunteer Infantry, and subsequently a practitioner in Philadelphia, died at his home in Philadelphia, May 29, from septic infection, aged 62.

**Milton Bottman, M.D.** Johns Hopkins University, Baltimore, 1901, a promising young physician of Cincinnati, who had been doing post-graduate work abroad, died from appendicitis in Paris, after a short illness, May 30, aged 27.

**Alfred Lee Royce, M.D.** a surgeon in the United States Navy and chaplain of the Naval Home in Philadelphia, recently died from nephritis, in New York City, aged 56.

## Societies.

### COMING MEETINGS.

Colorado State Medical Society, Pueblo, June 17, 1902.  
American Medico-Psychological Association, Montreal, June 17-20, 1902.  
Minnesota State Medical Society, Minneapolis, June 18, 1902.  
Medical Society of New Jersey, Atlantic City, June 24-26, 1902.  
Washington State Medical Society, Tacoma, June 24-26, 1902.  
Michigan State Medical Society, Port Huron, June 26-27, 1902.  
Medical Association of Nevada, Virginia City, July 7, 1902.  
American Ophthalmological Society, New London, Conn., July 16, 1902.

**Essex North District (Mass.) Medical Society.**—This Society held its annual meeting at Lawrence, May 7, electing Dr. John F. Croston president, and Dr. Maurice D. Clarke secretary, both of Haverhill.

**Eastern Oregon District Medical Society.**—This Society will meet at Hot Lake, Ore., July 16. Reduced rates have been secured on all O., R. and N. lines and a large and enthusiastic meeting is expected.

**Glynn County (Ga.) Medical Society.**—This Society was organized at Brunswick, May 23, with the following officers: President, Dr. Judson A. Butts; vice-president, Dr. John C. Egelston; secretary, Dr. Robert E. Lee Buford, and treasurer, Dr. W. Churchill Hatcher, all of Brunswick.

**Miami Medical Society.**—The forty-ninth annual meeting of this Society was held at Loveland, Ohio, May 20. Dr. Con W. Gatch, Milford, was elected president; Dr. Nelson B. Van Winkle, Blanchester, vice-president; Dr. John D. Waketield, Loveland, secretary, and Dr. Aaron Morris, Goshen, treasurer.

**The Alumni Association of the Woman's Medical College** has elected the following officers for the ensuing year:

President, Dr. Louise Erich; vice-president, Dr. Sue Radcliffe; secretary, Dr. Anna C. Shipley; treasurer, Dr. Jennie N. Broune; executive committee, Drs. Fannie E. Hoopes, Charlotte S. Murdoch, and Mary N. Broune.

**Connecticut Valley Medical Association.**—The annual meeting of this Society was held in Belkows Falls, Vt., May 13. Dr. Frederick L. Osgood, Townshend, Vt., was elected president; Dr. Gardner C. Hill, Keene, N. H., vice-president; Dr. J. Sutcliffe Hill, Belkows Falls, Vt., secretary, and Dr. Edward R. Campbell, Belkows Falls, Vt., treasurer.

**Adams County (Ill.) Medical Society.**—At its annual meeting, held in Quincy, May 12, the following officers were elected: Dr. William F. Gilliland, Coatsburg, president; Drs. Edmund B. Montgomery and John D. Justice, Quincy, vice-presidents; Dr. John A. Koch, Quincy, secretary, and Dr. Levin H. A. Nickerson, Quincy, treasurer.

**Franklin District (Mass.) Medical Society.**—This Society held its annual meeting at Greenfield, May 13. Dr. Halbert G. Stetson, Greenfield, was elected president; Dr. Francis J. Canedy, Shelburne Falls, vice-president; Dr. Benjamin P. Croft, Greenfield, secretary and treasurer, and Dr. Charles Bowker, Bernardston, commissioner of trials.

**Good Samaritan Hospital (Cincinnati) Ex-Internes' Association.**—The annual meeting and banquet of this body were held at Cincinnati, May 5. The election of officers resulted as follows: Dr. Theodore Potter, Indianapolis, president; Drs. Isaac D. Jones, Cincinnati, Stephen C. Markley, Richmond, Ind., and B. F. Beech, Cincinnati, vice-presidents; Dr. Robin W. C. Francis, Cincinnati, secretary, and Dr. John P. Miller, Cincinnati, treasurer.

**Franklin County (Vt.) Medical Society.**—The annual meeting of this Society was held in Richford, May 8. The business transacted included a revision of the by-laws, and it was voted to reorganize and affiliate with the Vermont State Medical Society and the American Medical Association, in accordance with the plans, and in compliance with the terms suggested by these bodies. The officers elected were as follows: Dr. E. Paul Lunderville, St. Albans, president; Dr. Eber L. Washburn, East Berkshire, vice-president, and Dr. James N. Jenne, St. Albans, secretary.

**Worcester District (Mass.) Medical Society.**—This Society held its annual meeting in Worcester, May 14. Dr. Edward W. Taylor, Boston, delivered an address on "Some Fundamental Points in Neurological Diagnosis." The following officers were elected: Dr. Samuel B. Woodward, Worcester, president; Dr. Walter P. Bowers, Clinton, vice-president; George E. Emery, Worcester, secretary; Dr. George O. Ward, Worcester, treasurer; Dr. Roscoe W. Swan, Worcester, orator; Dr. Charles H. Perry, Worcester, commissioner of trials, and Dr. Albert C. Getchell, Worcester, librarian.

**Essex South District (Mass.) Medical Society.**—The ninety-eighth annual meeting of this Society was held in Salem, May 13. Dr. George Z. Goodell, Salem, read a paper on "Medical Aspects of Salem Witchcraft," and Dr. Ernest W. Cushing, Boston, delivered an address on "The Abuse of Medical Charity." Dr. Charles W. Haddock, Beverly, was elected president; Dr. Edward L. Pierson, Salem, vice-president; Dr. Harry E. Sears, Beverly, secretary; Dr. George Z. Goodell, Salem, treasurer; Dr. George K. Blair, Salem, librarian, and Dr. Justin Allen, Topsfield, commissioner of trials.

**Academy of Medicine of Cleveland.**—The consolidation of the Cleveland Medical Society and Cuyahoga Medical Society into a new organization, to be known as the Academy of Medicine of Cleveland, has been completed. The Academy is to meet monthly and sections devoted to various branches of medicine and surgery are to be formed. These are to meet from time to time at the rooms of the Cleveland Medical Library. At the first meeting, held May 24, Dr. Frank E. Bunts was elected president; Dr. William T. Howard, vice-president; Dr. Walter H. Merriam, secretary, and Dr. John M. Ingersoll, treasurer.

**Iowa Medical Women's Society.**—This Society held its annual meeting at Des Moines, May 20. The morning session was devoted to business; in the afternoon Mrs. Ella Hamilton Durley welcomed the visitors on behalf of the City Federation of Clubs, papers were read and officers elected, and in the evening a banquet and reception were held. The following are the newly-elected officers: Dr. Jessie V. Smith, Winterset, president; Drs. Mamie A. Coveny, Clinton, and Sophie H. Scott, Des Moines, vice-presidents; Dr. Agnes Eicheiberger, Sioux City, treasurer; Dr. Jennie McCowan, Davenport, corresponding secretary, and Dr. Mary A. Green, Lemars, recording secretary.

**Alumni Association of Jefferson Medical College.**—The annual banquet of this Association took place at the Art Club, Philadelphia, May 28. A hundred members and guests were present. Dr. William H. Hartzell, Allentown, president of the association, was toastmaster. Prof. Edward P. Davis, Philadelphia, responded to the toast "The Faculty"; Dr. George B. McClellan, Philadelphia, "The Alumni," and Dr. John M. Fisher, Philadelphia, "The Demonstrator." Officers of the Association were elected as follows: President, Dr. Thomas D. David, Pittsburg; recording secretary, Dr. Frank C. Hammond; corresponding secretary, Dr. Charles S. Barnes; treasurer, Dr. William M. Sweet, all of Philadelphia.

**Greene County (Ohio) Medical Society.**—In order to encourage a fraternal interest and to bring the profession into closer unity, the Greene County Medical Society, in celebrating its fifty-second annual meeting, June 5, at Xenia, decided to entertain, and issued invitations individually to the physicians of Clinton County and to every member of the Montgomery County Medical Society. Besides the 30 members of the Society about 75 were present from the adjoining counties. Dr. Charles A. L. Reed of Cincinnati was the Society's honored guest, and presented a preliminary report of original research work relative to "Restorative Treatment of the Uterine Appendages." Following the discussion and banquet an excellent program was carried out.

#### AMERICAN GYNECOLOGICAL SOCIETY.

*Twenty-seventh Annual Meeting, held at Atlantic City, N. J., May 27-29, 1902.*

President, Seth C. Gordon, M.D., Portland, Maine, in the Chair.

An Address of Welcome was delivered by Dr. Philander A. Harris, of Paterson, N. J., to which President Gordon responded.

#### Wandering Spleen.

DR. THOMAS A. ASHBY, Baltimore, reported "A Case of Wandering Spleen Packed in the Pelvis and Complicated by Typhoid Fever: Splenectomy, with Recovery." The author drew attention to the anatomy and function of the spleen. He said its size was influenced by bodily nutrition, the organ being large in the well-nourished, and small in the poorly-fed individuals. In 1887 McCann reported 19 cases of splenectomy, with 13 recoveries. These cases were reported by 18 different surgeons. Sixteen were observed in women, and 3 in men. In properly selected cases there was no doubt that the spleen could be removed with as good results as those which followed the removal of the uterus, the ovaries, or kidney.

The chief interest in his case was from the standpoint of diagnosis. The patient, a young woman, had lived all her life in a malarial section of country, and had had repeated attacks of malarial fever. She had contracted a malarial spleen which, from its increased size and weight, had exercised such traction upon the splenic ligaments as to permit the spleen to wander down into the pelvis, where it became impacted behind the uterus and filled the pelvic basin. How long it had remained in this position there was no way of determining. In the meantime, she became infected with the typhoid organism and developed typhoid fever. In the initial stage of the disease her temperature took a high range, and pelvic pains were soon felt. Her family physician, being called in at once, palpated the abdomen, and finding a large mass in the pelvis, well above the brim, with marked tenderness and high temperature, concluded that he had a large inflammatory tumor to deal with. At this time there were no typical symptoms and there were no typhoid cases in her family or neighborhood. He at once brought the patient to the hospital for treatment. At the time of the first examination the physical signs were markedly those of an inflammatory mass in the pelvis. There was pain on pressure, a doughy sensation to the touch, and the skin over the region of the tumor was so red and shiny that the surface indications were those of a suppurating mass ready to break through the skin. When anesthetized the following morning the physical signs had markedly changed, and Dr. Ashby's diagnosis, before opening the abdomen, was that of an ovarian cyst or myomatous tumor. He determined to make an incision to find out the true character of the condition and to

remove the same. As soon as the incision was made, the spleen was discovered, and its removal at once decided upon. The enlarged size of the organ, length and weakness of its ligaments made an attempt at its restoration and attachment to its normal position a physical impossibility. The only safe course was to remove the organ, and this was done without the least difficulty, as its pedicle was not larger than one's little finger at the point of its attachment under the diaphragm. It was ligated in section, and the stump well covered with peritoneum. The subsequent behavior of the patient's temperature could not be accounted for until the typical typhoid reaction was obtained some six or seven days after the operation. From that time on the typhoid condition was regarded as the primary disease, and was treated accordingly. The abdominal section presented no features to occasion the least alarm. Patient ran the regular course of the fever, and her convalescence was uneventful. Her health since her recovery has been better than prior to the attack of typhoid fever.

DRS. I. S. STONE, WILLIAM T. HOWARD, LAPHORN SMITH, A. PALMER DUDLEY, J. WESLEY BOVEE and JOSEPH E. JANVRIK reported cases of splenectomy.

#### The Medical Side of Gynecology.

DR. EDWARD W. JENKS, Detroit, said that there was a medical side to gynecology which could not be ignored, for a special training, together with a thorough knowledge of general medicine, were prerequisites for the making of an ideal gynecologist. Fully one-half of the women seeking advice and relief from disorders peculiar to their sex were suffering from some deranged condition of the eliminative organs, as shown by constipation or defective elimination of solids in the urine. Even where there were lesions in the pelvic organs, no relief from distressing symptoms could be secured until the underlying constitutional causes of pain and general poor health were first ascertained and removed. There were many derangements of the system which closely resembled diseases of the pelvic organs. Pain in the back, the commonest complaint of women, might be due to coccygodynia, myalgia, chronic malarial toxemia or other constitutional causes; pain in the abdomen sometimes attributed to the ovaries might be due to habitual constipation, or to an atonic condition of the large intestine.

He was convinced that some of the medical schools were responsible for the neglect of medical gynecology. Surgical technic was taught in all its refinements, but symptomatology, differential diagnosis and the treatment of diseases of women amenable to medicinal remedies could not receive adequate attention in the brief time devoted to them, if one judged by the results. The glamor of gynecologic surgery had obscured the commonplace, but equally important, study of gynecologic medicine. He made an eloquent plea for the medical side of gynecology, and urged that it be not relegated to obscurity in our zeal to advance gynecologic surgery. He entered his protest against so many calling themselves gynecologists who ploughed only in one furrow of the field of gynecology, while the field itself was only a part of the great domain of medicine and surgery.

#### Lacerations of the Cervix Uteri and Pelvic Floor.

DR. W. L. BURRAGE, Boston, read a paper on these conditions, in which he made a plea for their more careful study, their diagnosis and treatment. He said the glamor of successful abdominal surgery had left the less dangerous and less showy plastic surgery in the background. Lacerations of the cervix and pelvic floor merited a more careful study than they had received; that if they were repaired early, fewer major mutilating operations would be called for later; that the normal conditions were the ones the gynecologist should endeavor to restore, and until he was successful in doing this no attempt should be made to improve nature. Emmet gave the principles underlying repair of lacerations of the pelvic floor to the profession in 1883. These had been generally accepted as correct, and as yet no one had proved them to be erroneous. He urged the members of the society to stand by these principles and to devote their energies to perfecting details of operative technic rather than to invent or advocate operations which involved principles diametrically opposed to those of Emmet.

He had operated for laceration of the cervix two hundred and one times, and for lacerated perineum and pelvic floor a hundred and sixty-two times.

#### Symposium on Retrodisplacements of the Uterus.— Etiology, Pathology and Symptoms.

DR. MATTHEW D. MANN, Buffalo, N. Y., discussed this part of the subject. He believed that the round ligaments were important factors in holding the uterus in place, and that they acted in the manner pointed out by Kellogg. If the ligaments be stretched, the uterus falls behind the center of gravity, and the round ligaments are not able to pull it far enough forward, so that the intra-abdominal pressure falls on the posterior wall, with every effort to increase backward displacement. Weakening of the pelvic floor, relaxation of the pelvic outlet as the result of childbearing, with or without rupture of the perineum, will allow the uterus to sag downward, and the fundus to fall backward. Relaxation of any of the supports of the uterus tends to backward and downward displacement of the uterus, and if the ligaments and pelvic floor are relaxed, then eventually there will be prolapse to a greater or less extent, dependent upon the amount of relaxation. He spoke of the uterovesical ligament as having considerable influence in the production of uterine displacement. He mentioned other factors which caused the uterus to become displaced backward, one of which was rupture of the perineum, which enables the vaginal walls to come down. If these came down, with cystocele or rectocele, then the vaginal wall, dragging upon the cervix, pulls the organ downward, and tips it over backward.

In displacement of the uterus the circulation and nutrition of the organ are interfered with, so that in a short time the woman would get a chronic congestion, with thickening and enlargement of the connective tissue of the uterus. This might be called, for want of a better term, chronic metritis.

Another cause of displacement of the uterus was laceration of the cervix, which allowed the organ to sink down into the pelvis, to turn slightly backward, the displacement going on from bad to worse. He had seen two cases of displacement of the uterus, one following whooping-cough in an adult, the other from straining at stool. In the latter case the uterus was forced outside of the body from constant straining at stool, although the hymen was intact. He then mentioned the symptoms of retrodisplacement of the uterus and among them he spoke of backache, bearing-down pains in the pelvis, etc. He did not believe that every case of posterior displacement of the uterus caused symptoms, but the majority of cases of backward displacement did cause symptoms. A woman with a backward displacement of the uterus would not continue to be well. She might be well for the time, but eventually she would suffer. He did not believe a backward displacement of the uterus could exist for any great length of time without the woman suffering more or less. Besides the symptoms familiar to the gynecologist, he thought there were a great many reflex symptoms. A woman with a retrodisplaced uterus might suffer a great deal from reflex symptoms without the presence of pelvic symptoms. He cited cases in point.

*(To be continued.)*

#### MEDICAL SOCIETY OF THE STATE OF WEST VIRGINIA.

*Thirty-fifth Annual Meeting, held at Parkersburg,  
May 21-23, 1902.*

President, G. A. Aschmann, M.D., Wheeling, in the Chair.

#### Welcome.

The Society was welcomed to Parkersburg by Hon. J. W. Vandervort, mayor of the city, and Dr. Thomas A. Harris, Parkersburg, responded on behalf of the Society. The meeting proved to be the most successful ever held by the society. The attendance was large and eighty new members were taken in, which is more than twice the largest number ever taken in at one meeting. The scientific quality of the papers read was exceptionally high and the animated discussions added much to their value.

#### President's Address.

DR. GUSTAVUS A. ASCHMANN, Wheeling, in his address discussed chiefly the reorganization of the Society on the plan suggested by the American Medical Association. This plan he favored strongly. He also advocated the erection of a state hospital for the treatment of tuberculosis.

#### State Medicine.

DR. WILLIAM S. KEEVER, Parkersburg, delivered the address on State Medicine, in which he showed clearly and succinctly the benefits the Society and the profession would derive from needed legislation.

#### Smallpox.

DR. W. O. MAGILL, Morgantown, read an interesting essay on "The Etiology of Smallpox; With Special Reference to Its Microbiology and Demonstration of Its Microbe."

#### Tuberculosis.

DR. CHARLES F. ULRICH, Wheeling, delivered an address on the "Hygienic Treatment of Tuberculosis," in which he thoroughly discussed the origin and treatment of the disease in all its stages.

DR. JOHN L. DICKEY, Wheeling, then read a paper in which he detailed the treatment in the past.

DR. WILLIAM A. CALDWELL, Morgantown, next described the modern methods of treatment.

The reading of these papers was followed by a vigorous discussion, opened by Dr. William W. Golden, Elkins.

Among the other papers were the following: "An Analysis of 150 Operations for the Radical Cure of Hernia," by Dr. Frank Martin, Baltimore; "Movable Kidney," by Dr. Robert J. Reed, Wheeling; "Some Features of Medical and Surgical Study in London and Berlin," by Dr. A. S. Grimm, St. Marys; "Intestinal Anastomosis," by Dr. John R. Cook, Fairmont; "Tonsillitis," by Dr. V. T. Churchman, Charleston; "Tubercular Peritonitis," by Dr. J. Schwinn, Wheeling; "Some of the Effects of Typhoid Fever on the Nervous System," by Dr. C. C. Hersman, Pittsburg; "Spinal Anesthesia with Report of Cases," by Dr. O. O. Cooper, Hinton; "On the Management of Rectal Diseases," by Dr. Wm. M. Beach, Pittsburg; "The History of a Bullet in the Apex of a Human Heart for Thirty-five Years," by Dr. E. T. W. Hall, Weston; "Quarantine," by Dr. T. L. Barber, Charleston, W. Va.

#### Banquet.

On May 22, the annual banquet tendered by the local medical profession was held at the Blennerhassett Hotel and was attended by about 125. Dr. Hiram B. Stout, Parkersburg, was toastmaster and Drs. Charles F. Ulrich, Wheeling; Brooks F. Beebe, Cincinnati; Louis D. Wilson, Wheeling; Timothy L. Barber, Charleston, and Edwin S. Ricketts, Cincinnati, and others responded to toasts.

#### Reorganization.

On the third morning the most important transaction was the discussion of the motion to make a general revision of the Constitution and By-Laws of the organization, to be in entire conformity with those of the American Medical Association. The Society has grown with such rapidity and to such size that such a step was found to be not only expedient, but necessary. The adoption of the Constitution and By-Laws of the National Organization was made by unanimous vote of the meeting. A number of departures, however, had to be made on account of the very small number of county societies now in the state. From now on the Society is to be known as the West Virginia State Medical Association.

#### Election of Officers.

The following officers were elected for the ensuing year: President, Dr. Hiram B. Stout, Parkersburg; vice-presidents, Drs. Robert A. Haynes, Clarksburg, Spencer S. Wade, Morgantown, and Harriette B. Jones, Wheeling; secretary, Dr. William W. Golden, Elkins; treasurer, Dr. Vincent T. Churchman, Charleston; delegate to the American Medical Association, Dr. L. D. Wilso, Wheeling, and alternate, Dr. D. P. Morgan, Clarksburg.

Charleston was selected as the meeting-place for May, 1903.

## Therapeutics.

[It is the aim of this department to aid the general practitioner by giving practical prescriptions and, in brief, methods of treatment for the diseases seen especially in every-day practice. Proper inquiries concerning general formulae and outlines of treatment are answered in these columns without allusion to inquirer.]

### Follicular Conjunctivitis.

Follicular conjunctivitis, according to Drs. Wood and Woodruff, in *Med. Standard*, is a catarrhal conjunctivitis to which has been added an overdevelopment or hypertrophy of the lymph follicles. They recommend as treatment the local application of cold compresses followed by a mild antiseptic lotion similar to the following:

|                                 |        |     |
|---------------------------------|--------|-----|
| R. Acidi hydrocyanici dil. .... | gtt. i | 60  |
| Acidi boracici .....            | 3ss    | 2   |
| Sodii boratis .....             | gr. xl | 266 |
| Aq. destil. ....                | 3ii    | 60  |

M. Sig.: One or two drops to be instilled into the eye once or twice daily.

In cases of trachoma or chronic granular conjunctivitis the conjunctival sac should be thoroughly cleansed with boracic acid or weak bichlorid solution and later some astringent preparation applied, such as the following:

|  |       |    |
|--|-------|----|
| R. Cupri sulph. vel. acidi tannici ..... | gr. x | 66 |
| Vaselini .....                           | 3i    | 30 |

M. Ft. ung. Sig.: Apply between the lids once or twice daily. In the early stages, when the granulations are excessive and prominent, massage of the lids with the following is recommended by them:

|                              |       |    |
|------------------------------|-------|----|
| R. Hydrarg. oxid. flav. .... | gr. v | 30 |
| Lanolini .....               | 3ss   | 30 |
| Vaselini .....               | 3ss   | 30 |

M. Sig.: To be applied to the lids and thoroughly rubbed in.

### Iodic Acid in Trachoma.

According to *Merck's Archives*, Dr. Ichile, in *Rev. de Ther.*, states that iodic acid liberates iodine, and hydriodic acid is formed, destroying the follicles, killing the microbes and favoring leucocytosis. No scars result from the cauterization. In acute and subacute forms of granular conjunctivitis the author employs 5 per cent. solutions of iodic acid for irrigating the mucous membrane. In the initial period of trachoma he uses instillations of a 3 per cent. solution. In the cicatricial form of trachoma an ointment is preferable, as follows:

|                       |         |    |
|-----------------------|---------|----|
| R. Acidi iodici ..... | gr. xii | 75 |
| Lanolini .....        | 3vi     | 24 |
| Olei olivæ .....      | 3vi     | 24 |

M. Sig.: To be applied locally once daily.

The action of the iodic acid may be assisted by the simultaneous administration of potassium iodid.

For masseeing the palpebral mucous membrane the following salve is used:

|                       |          |    |
|-----------------------|----------|----|
| R. Acidi iodici ..... | gr. xv   | 1  |
| Sodii iodidi .....    | gr. lxxv | 5  |
| Acidi borici .....    | 3iiss    | 10 |
| Vaselini .....        | 3iii     | 90 |

M. Sig.: Apply locally by massage to the mucous membranes.

Iodic acid is a colorless solid appearing in the form of rhombic crystals; it is soluble in water, insoluble in alcohol; for use as a caustic it is made up in the form of sticks. In employing about the conjunctival membrane, the strength of solution mentioned in the foregoing should be used.

### Treatment of Lupus with Permanganate.

Butte, as stated in *Amer. Med.*, recommends the following: The entire locality affected with lupus is carefully washed either with ichthyol soap or with the following antiseptic emulsion:

|                              |         |     |
|------------------------------|---------|-----|
| R. Hydrarg. bichloridi ..... | gr. v   | 30  |
| Tinct. benzoini .....        | m. lxxv | 5   |
| Tinct. saponis .....         | 3iiss   | 45  |
| Aq. destil. ....             | 3vii    | 210 |

M. Sig.: As a wash locally.

After applying this, follow with a compress saturated with a warm 2 per cent. solution of potassium permanganate, to be kept on fifteen minutes. This treatment is to be repeated every day. In about ten days the tubercles are covered with a blackish coating and to the touch they no longer give the sense of elevation, but are atrophied and what is left of them is of a soft consistence. After the first ten days, the treatment is to be applied only every other day, but must be continued for a period of two or three months. At the end of this time no more tubercles are to be seen and the skin presents a smooth appearance; though it is red and cicatricial in character, the process seems to be arrested. Should any new tubercles reappear, a few applications of permanganate causes them to disappear.

### A Spray in Asthma.

Dr. A. Abrams, in *Med. Fortnightly*, recommends the following as a spray in treatment of asthma:

|                              |        |     |
|------------------------------|--------|-----|
| R. Antipyrini .....          | gr. xv | 1   |
| Pyridin .....                | 3i     | 4   |
| Sod. nitritis .....          | 3ii    | 8   |
| Tr. lobelia (ethereal) ..... |        |     |
| Tr. belladonnae .....        |        |     |
| Tr. stramonii, aa .....      | 3v     | 20  |
| Tr. ipeacacanthæ .....       | 3iv    | 15  |
| Glycerini q. s. ad .....     | 3iv    | 120 |

M. Sig.: To be used in the form of a spray.

[It has been a question among the profession as to how much of the respiratory tract can be reached by means of inhalation. It would seem more improbable that the bronchioles could be reached by means of a spray.]

### Scrofulous Conditions in Children with Enlarged Lymphatics.

The following outline of treatment is recommended by *Merck's Report* in the treatment of enlarged lymphatic glands of a scrofulous nature in children:

|                             |          |     |
|-----------------------------|----------|-----|
| R. Iodipin .....            | 3i       | 30  |
| Spts. vini gallici .....    | 3ii      | 8   |
| Yolk of eggs (2) .....      |          |     |
| Olei aurantii .....         | gtt. iii | 20  |
| Olei vel. menthae pip. .... | gtt. ii  | 12  |
| Olei morrhuae .....         | 3vi      | 180 |

M. Sig.: One or two teaspoonfuls three times a day.

It may be given plain as follows:

|                     |       |     |
|---------------------|-------|-----|
| R. Iodipin .....    | 3i    | 30  |
| Olei aurantii ..... | m. ii | 12  |
| Olei morrhuae ..... | 3vii  | 210 |

M. Sig.: One teaspoonful three times a day in milk. The alterative properties of the cod-liver oil are reinforced by the absorbent and solvent properties of the iodine in the iodipin which contains 10 per cent. of iodine. At the same time the following ointment should be applied at night or in severe cases night and morning:

|                        |      |    |
|------------------------|------|----|
| R. Guaiacol. ....      | 3i   | 4  |
| Ung. pot. iodidi ..... | 3iii | 12 |
| Lanolini .....         | 3iv  | 15 |

M. Ft. unguentum. Sig.: Apply at night and wash the in the axillæ.

## Medicolegal.

**Admissible Evidence of Undertaking of Physician.**—The Supreme Court of Minnesota holds, in the case of Pickler vs. Caldwell, that an offer of evidence, at the trial of an action brought to recover for professional services, to show that a party had volunteered to call upon the suing physician for an invalid, and did afterward call, when the physician offered, through him, to effect a cure or make no charge, with a communication to the invalid or what had occurred at the physician's office, was improperly excluded, under issues that presented the question whether the physician's treatment had benefited the invalid. The court thinks that an offer of that character would tend to establish a relationship of principal and agent between the party and the invalid, and that the statements made to him by the physician, communicated and

acted upon, would have a proper legal tendency to support the defense.

**Liability for Use of Property for Pesthouse.**—The Supreme Court of Washington holds, in the case of Brown vs. the County of Pierce and the City of Tacoma, that where property was seized and used for a pesthouse the owners were entitled to recover the actual value of the use of the property for that particular purpose. It holds that the jury was properly instructed in this case as follows: "The measure of damages in a case of this kind would be and will be what you believe from the evidence would be the fair and reasonable rental value of that property for the purpose for which it was taken and used. It is what damage the property sustained by reason of having been used for a pesthouse. And you must arrive at the measure of damages—ascertain the measure of damages—from the evidence, not from any preconceived notions of your own, but from the evidence brought out upon the trial, and from that come to your conclusion." Here, the county physician assisted in finding the house in question, in connection with a representative of the city health department, caused patients to be sent there, and attended them in person. He also testified that on the same day of the selection of the house he reported to the chairman of the County Board of Health, and asked him how he was to care for the patients; to which the chairman replied that he should go ahead and use his best judgment, which he said he did. From this the court thinks that it was properly a question for the jury whether the patients were county charges, and, if so, whether their treatment in the house by the county's physician was an occupation for the use of the county, and acquiesced in by the county authorities. In times of pestilence action must be promptly taken, and health boards may not be able to meet quickly for formal action. Some one should therefore have power to act. Even though it were true that the physician mentioned was not county health officer, but only county physician, if nevertheless he attended patients quarantined in this building, acting as county physician in behalf of those for whom the county assumed to care, the court does not see that it was material whether he was a fully qualified health officer or not. If he was the qualified health officer of the county, as he testified, under the exigency calling for immediate action, he had sufficient power to act without express authorization by the board of county commissioners.

1. *Anguillula Aceti* in the Urine.—Billings and Miller report a case in which a form resembling the *Anguillula stercoraria* was found present in the urine. They compared this species with the common vinegar eel and found a very close resemblance, the chief point of difference being in the males, where the *A. aceti* is slightly longer, and the young forms differ

in that the esophageal enlargement does not appear so early in the *A. aceti*. The females of the free form of *A. stercoralis* are less than half the length of the females of the *A. aceti*, but possess the same esophageal enlargement. The females of the parasitic generation correspond in length with the *A. aceti*, but do not have the esophageal enlargements. The nematode found in the urine resembles in every particular the *A. aceti* and one seems justified in these two cases in saying that the worm present was the *A. aceti* or vinegar eel.

**2. Pneumococcus Arthritis.**—Two cases of this rare condition are reported by Cole, who reviews the previously collected cases by Cave, and adds 11 more, including those here published. In a study of 42 cases altogether, one being omitted, however, as not being sufficiently thoroughly examined, he finds that they can be divided into two great groups: 1, those appearing as complications or sequelæ of acute lobar pneumonia, 34 of the 41 cases belonging to this group; 2, cases of arthritis preceding or occurring independently of acute lobar pneumonia. There were eight of these, and two histories of which are here reproduced. The most important facts in regard to pneumococcus arthritis, many of which have already been pointed out by Cave, are stated as follows: 1. A tendency to involvement of the larger joints, though small joints may be involved. 2. A tendency to the involvement of more than one joint (13 out of 41 cases). 3. A tendency to involvement of joints already the seat of a chronic affection. (In 13 cases a history either of chronic rheumatism, old injury, previous arthritis or gout.) 4. The effusion is usually purulent, but may be serous. 5. The mortality is high (28 deaths, 13 recoveries). 6. The clinical features of the condition and the prognosis depend more on the septicopyemia, of which it is usually but a manifestation, than on the joint lesion itself. When recovery occurs, the course is usually a long, slow one, and usually ankylosis of the joint results. 8. The local treatment should consist in free opening and draining of the joint. The fact that in a few cases of mild infection of the smaller joints spontaneous recovery has occurred, might justify one in adopting conservative methods in such cases. He also reviews Cave's summary of the experimentally produced acute pneumococcus arthritis and mentions the experimental conditions produced by Bezancon and Griffon by modifying the resistance of the animal experimented on in relation to the virulence of the pneumococcus.

**3. Septal Deflections.**—Kyle reports certain slight modifications of his V-shaped cut in correcting septal deviations and describes a simple method of correcting deviations of the septum with external deformity as follows: First a small oblique incision is made through the skin into the nasal cavity on the convex side of the deflection just at the point of junction of the cartilage and bone, through which the small saw or file saw is then inserted and a V-shaped portion of cartilage removed. This should extend down on the septum a sufficient distance to break up all resiliency, and the amount removed should be sufficient to render the cartilaginous portion of the nose entirely pliable. The external wound is then closed by one suture, as it is not necessary to make an incision over  $\frac{1}{8}$  to  $\frac{1}{4}$  inch in length. It is then sealed with collodion over cotton. The internal deformity is corrected the same as given above where no external deformity exists. It is of importance that a sufficiently large V-shaped piece be removed in order to render the septum perfectly pliable; in other words, to remove all redundancy. The principle involved in correcting the external deformity is identically the same as for the correction of the internal deflection of the septum. The prime object in all septal operations is to remove redundancy and break up resiliency. General anesthesia is preferable, although the operation can be done under local anesthesia.

**4. Plague.**—Curry reports a case occurring in a civilian employé of the quartermaster's department at Manila, with bacillary diagnosis, etc. He describes the different types of the disease, calling attention to the walking cases. The diagnosis must largely depend upon laboratory examination in the early stages. He considers plague a place infection depending largely on dirt and frequently due to inoculation from skin diseases,

and the possibility of infection through coitus is also worthy of consideration. Pulmonic plague must often be due to inhalation of infected dust and animal experimentation shows that it may occur through the gastro-intestinal tract by infected food. For prophylaxis he insists on, 1, cleanliness; 2, the destruction of rats and mice; 3, protection of food and drink from all possible contamination by insects; 4, special attention to all skin diseases or abrasions through which the disease might be introduced.

**5. Phthisis.**—The measurements of the height, weight, respiratory power and the mobility and vital capacity of the chest, are dealt with by Upson. He holds that persons of more than average stature seem to be rather liable to the condition. In most cases of pulmonary tuberculosis there is a certain relation between the respiratory power and the vital capacity. In the early stages the inspiratory power is often lowered, while the expiratory power is unimpaired, but is lowered later. He has not infrequently tested the impairment of the chest movement in persons showing but few other signs and calls attention to certain changes in the shape and size of the neck noticed on the side of the affected lung, consisting in wasting at its base and perhaps a slight flattening apparent on that side owing to the flattening of the summit of the chest. He gives a tabulated statement of his measurements of individuals after and before the inception of the disease, showing the weight, length and semicircumference of the chest, its mobility, thoracic perimeter, respiratory power in inches of mercury and semicircumference of the neck. He is so convinced of the value of the signs obtained by mensuration that he uses it as a routine method, and always when, as is usually the case, a number of following symptoms are present, viz.: prominent bright eyes, often with dilated pupils; morning pallor; a feeling of fatigue on arising in the morning, even after a good night's rest; more or less shortness of breath on slight exertion; a quickened pulse unaffected by a change of position; an evening rise of temperature, and a dry hacking cough on assuming a recumbent posture. These measures give good warrant for treating the cases as tubercular.

**7. Cancer.**—Smith has analyzed the cancer statistics of the District of Columbia and draws the following conclusions: 1. On the basis of comparing cancer deaths with those of 30 years and over, no increase of the disease is found in the last decade over the preceding. 2. Classification of cases into accessible and inaccessible reveals practically no increase in the former but entirely in the latter, probably the result of improved diagnosis and certification of deaths. 3. Aside from cases of the female generative organs, the sexes are equally liable to the disease. 4. The white and colored races are alike subject to cancer, the latter showing a greater increase in cases of the uterus and liver. 5. While cancer deaths during the last decade have increased over those of the previous decade by a larger percentage than those from any other disease, we are not justified in attributing this to an increase in the disease itself.

**8. Cholelithiasis.**—Lilienthal reports 10 cases of operation for cholelithiasis, mostly cholecystectomies, which he considers the best operation when practicable. The gall-bladder has perhaps a function, but he does not think it has ever been discovered.

**9. Acroparasthesia.**—The first part of Collins' article is historical. He thinks the condition not uncommon; 100 cases have come to his hand in the last five years, excluding all such as were associated with neuritis, arthritis, rheumatism, gout, etc. The symptom is in many cases simply numbness, but there is a wide variation in the type and it may vary in severity from slight disagreeableness to severe pain. The average age of his cases was 39, the range was from 17 to 79 years; 69 were females and 31 males; 34 were Americans; 41 Russian Jews; 15 English, Scotch and Irish, and the remainder German and French. He finds that men are apparently more often affected than has been previously supposed and that many of his patients were tailors. The disorder seems to stand in close relationship to occupations which produce fatigue and, ex-

haustion of the upper extremities, as in tailors, dressmakers, etc., or those that necessitate keeping the hands in water. He sees little connection between it and exposure to cold and inclement weather. It is quite noticeable that gastro-intestinal disorder is frequently present. As regards its pathogenesis he seems to favor the idea of autointoxication either from intestinal indigestion, exhaustion, etc., though nothing is really positively known in regard to the matter. The principal thing in the treatment is the removal of the cause and the treatment of the accessory conditions that exist. Constipation should be looked after, with rest and a nourishing diet; new environments are necessary for early and complete cure. Tonic hydrotherapy, regulation of diet and the use of such tonics as iron, arsenic and strychnia will generally relieve. He has had gratifying results from the use of electricity, both the galvanic and the Franklinic currents, and he has also in some cases, where the attacks occurred early in the morning, seen good results follow the taking of a small quantity of trional or sulfonal on retiring.

**10. Chronic Non-Alcoholic Gastritis.**—Lockwood reports a number of cases and offers the following conclusions: 1. In uncomplicated chronic gastritis not of alcoholic origin, if the muscular power of the stomach be good, the only symptom apt to be referred to the stomach is acidity. This occurs in about half of the hyperacid cases, but may be observed in the cases of complete achylia. Cases with normal acidity, and the vast majority of cases of anacidity, give no gastric symptoms. 2. The hyperacidity cases may give a course resembling that of a neurosis in that the symptoms are intermittent and are easily influenced by nervous conditions. It would seem, however, that a long-continued gastric neurosis was exceedingly rare, and that the great majority of such neuroses were rarely the neurotic outbreak of an organic lesion. 3. In gastritis, contrary to the accepted teachings, the following negative facts are to be noted: (a) The appetite is good. The few exceptions are observed in advanced atony, where the quantity of food is not well born, and in cases of neurasthenia. In neither case, however, is the gastritis itself the cause of the anorexia. (b) Pain occurs in two ways: (1) From acidity, differing in no way from similar pain in cases of nervous hyperacidity; (2) From gas. This latter pain differs in no way from that observed in cases of simple atony without gastritis, so that pain does not seem to be a symptom of gastritis proper. (c) Nausea does not occur in relation to meals. Patients with atony, and those who are neurasthenic, may complain of nausea, but the nausea is not related to meals and does not interfere with a normal appetite. It usually occurs when the patient is tired or nervous. (d) Vomiting does not occur in the non-alcoholic cases. (e) Unless there be diarrhea the nutrition is good, and, as a rule, the patients are not anemic. Exceptions may be made in cases of atony, but in these cases the anemia may well be the primary condition. 4. If the muscular power be poor, gas is present as a prominent symptom. This is more apt to occur in hyperacid cases, and is probably due to swallowed air. As this same symptom is observed in a similar number of cases of simple atony, the symptom is not directly due to the gastritis. 5. Gastritis may give rise to severe and long-continued diarrhea and emaciation, which may be mistaken for colitis, or malignant diseases of the colon. The diagnosis, however, should present no difficulty if a careful examination be made. These cases are more common than is usually supposed, and occur both in the hyperacid, and in the anacid cases. Between the two a diagnosis is possible only by gastric analysis. 6. Biliousness and its allied symptom-complexes are rarely, if ever, due to a primary functional disturbance of the liver, but are almost regularly due to an intestinal toxemia, traceable to some derangement of gastric chemistry, whereby improperly prepared chyme enters the intestine. 7. Anemia and constipation are the chief and only symptoms in a great many cases of even well-marked gastritis, and their continuance without apparent cause should justify an analysis of the gastric contents.

**13. Prostatic Hypertrophy.**—Chetwood gives the history of operations for this condition and refers to his former article

in the *New York Medical Record* of May 18, 1901, in which he described his method of galvano-caustic incision of the prostate through a perineal opening. He has not altered the technic but has improved the instrument to some extent, giving it different side-blades to be changed at will and flexing the beak at an obtuse instead of a right angle. A small non-conducting metal piece 1/16 of an inch in height has been applied to the upper portion of the proximal side of the platinum blade to protect the sphincter muscle. The steps of the operation consist in opening the urethra upon a grooved staff. Digital exploration of the bladder is then made through this opening, and a correct knowledge of the nature and extent of the prostatic growth obtained. In some cases, in which the perineal distance is extreme and it is impossible to reach beyond the vesical neck, a specially devised retractor is employed to shorten the distance and to facilitate examination. The number of the galvanocautic incisions varies according to the nature of the growth and the manner in which it obstructs the bladder outlet. Generally speaking, such obstruction is produced by an obtruding middle lobe which blocks the orifice, by intravesical and urethral hypertrophy of the two lateral lobes which elevate a median fold of mucous membrane and flatten the vesical orifice, or by intra-urethral prostatic nodules. A median lobe is treated with one incision through the center or one on each side, when the intermediate portion may be excised. The bilateral enlargement is treated with two ample incisions directed at an angle toward the median line, which serve to widen the flattened urethral outlet and to drop the elevated fold of mucous membrane. Intra-urethral nodules are best enucleated in the usual way, and the operation completed by an intravesical galvano-caustic incision, if such is required. He reports a number of cases that have been operated on with good results and offers the following conclusions: Palliative measures should not be persisted in when they fail after reasonable trial to produce and maintain an abatement of symptoms. A first infection of the bladder is not alone sufficient excuse for operation unless palliative measures fail to promptly subdue inflammatory conditions. Recurring infection of the bladder or ascending infection of the kidney is sufficient warrant for operative interference. There is a growing tendency toward earlier operation than was formerly practiced. The greater number of cases of prostatic hypertrophy can be satisfactorily reached through a perineal incision. In the large majority of cases, the requirements of any operation upon the prostate consists in the removal of the obstructing area and depressing the bladder opening into the prostate, so that the *bas fond* may be properly drained. In many cases the obstructing area of the hypertrophied gland can be satisfactorily reached and effectually removed through a perineal opening by means of galvanocautic incisions.

**15. Conservatism in Abdominal and Pelvic Surgery.**—Ricketts thinks that conservatism is gaining ground with the specialist, but the occasional operators are extending their performances with bad results. He thinks that the general practitioner relying upon medical treatment and delay is sometimes more to be commended than the non-conservative extirpationists with their incomplete work.

**16. Colon Bacillus Infection.**—Burch reports a case, one of a class which he has met frequently of late and which has given him considerable trouble as to diagnosis. The cases referred to are fevers the duration of which is from seven to ten days. The attack is usually ushered in by a period of malaise that continues several days, the patient becoming rapidly worse until at last he is confined to his bed and the gradually rising temperature reaches its limit on about the fourth day, from which time it remains about 102 F. in the morning and from 103 to 104 in the afternoon. There is almost always some gastro-intestinal disturbances, sometimes diarrhea, less frequently constipation. The abdomen is at times distended and very often the case is accompanied with ileocecal regurgitation. The tongue is dry and often foul; there is sometimes mild delirium and almost always more or less headache. The whole clinical picture is that of typhoid fever and in every case there has been diminished leucocytosis. The urine fre-

quently contained traces of albumin and sometimes granular casts. Indican was present in every case. The urine contained peculiar motile organisms resembling Eberth's bacillus. The Widal-Johnsen reaction has been absent in every case throughout its entire course, but by employing a broth-culture of the bacilli found in the urine and the technic of the Widal reaction, agglutination was manifest in every case. He questions whether this is an abortive typhoid fever or whether of a peculiar type especially of infection due to the colon bacillus. All the patients had been working in the open air and ate heartily; ceased working and ate as before. This produced a condition of self-infection developing organisms with toxins which perhaps produced the symptoms. The question is, however, would not this also favor the Eberth bacillus as well and have we not here a mixed infection? He refers to the findings by Sacquépée in regard to the various races of the colon bacillus obtained from typhoid fever cases, and the only difference between his observations and the cases which came under Ricketts' eye were that in the former typhoid infection was severe, while in the latter it was of a mild type. Neither was the Eberth bacillus isolated, nor were agglutination reactions from broth cultures of the typhoid bacilli present.

**17. Fractures of the Femur.**—Burt holds that the use of Buck's apparatus with the femur in the straight position is certainly justified in some cases of fracture of the upper third of the femur and reports a case where this method succeeded while extension and inclined plane failed. The tendency of the upper fragment to tilt forward is completely overcome by the Buck apparatus, which brings both fragments into a straight line. The pelvis does the tilting, which often makes the fractured limb to appear longer, and for this reason he takes exception to the necessity of abducting the limb before applying the apparatus. He thinks those that favor pinning their faith to flexion should not depreciate those who have greater confidence in the straight position.

**18. Intestinal Obstruction by Bands.**—The rarity of such peculiarities seem remarkable when we consider the facts, as Lund remarks. He insists on the importance of adopting all means to prevent their formation, though it is probable that in many cases they disappear in time. Cases of incomplete removal of a septic organ, as where the inflamed stump of a Fallopian tube is left projecting into the abdomen, result in a constantly acting focus of infection and morbid growths; the omentum and appendices epiploicæ may also thus form bands causing intestinal strangulation. Meckel's diverticulum attached by one end to the abdominal wall and the other to the movable intestine, affords the best possible condition for angulation of the bowel. The coil of the intestine to which it is attached may become rotated on itself and thus twisted and strangulated as shown in a case here reported. Operations upon the lower part of the peritoneal cavity are naturally more likely to be the cause of internal strangulation of the bowel, on account of the gravitation of the loops of the intestine into that portion of the cavity. The symptoms of strangulation by adhesions are those of acute obstruction from other causes. Four cases are reported in detail.

**22. Infant Feeding.**—Dessau finds that for the vast majority of infants of all classes, the simplest and best food for daily use is a fair average quality of cow's milk, diluted with water according to the age and digestive capacity of the child. The "top milk," or the upper portion of milk that has been allowed to stand in a vessel at a temperature not above 60 degrees F. for from four to six hours, is sometimes preferable. The proportion of fat to proteids is much greater in such milk and will better bear diluting. A pinch of either table salt or phosphate of sodium is added, because cow's milk contains no soda salts, while human milk does, and a heaping teaspoonful of raw cane sugar to the quart. The mixture is placed in a double cooker, with cold water in the outer vessel, and allowed to remain on the fire for ten minutes after the water has begun to boil. This is virtually Pasteurizing the milk, which has become modified by dilution and the addition of salts and sugar. The principal and most important object of this process is not so much to attack germs as it is, as before

mentioned, to act upon the casein in such manner that the character of the curd will be modified by the milk-curdling ferment in the child's stomach, analogous to rennet in the stomach of the calf, without doing injury to other nutritious components, as the nucleins, globulins, and calcium salts. His experience with the use of steamed milk for the past six years has been extensive and quite satisfactory.

**23. Tonsillary Inflammations.**—The various forms of tonsillar disease are reviewed by Bissell, including the follicular tonsillitis which he describes and does not consider necessary to quarantine, being due to the staphylococcus aureus or albus, the type in which the Klebs-Loeffer bacillus is present, in which antitoxin treatment should be employed—not, however, to the neglect of local measures. The prognosis is favorable if proper treatment is adopted early and also in the streptococcus cases which are also severe, but are resistant to antitoxin and should, he thinks, receive some quarantine attention. Further, he mentions tonsillar inflammation from the micrococcus of sputum septicaemia which may be fatal. The treatment is the same as that of the streptococcus; the organism is, however, a common inhabitant of the human mouth and rarely infects, and quarantine seems hardly required. Brief mention is made of *Oidium albicans* as the cause of tonsillar inflammation, which is usually easily relieved by stimulating alkaline washes and tonics and requires no quarantine. In three cases an organism corresponding to the colon bacillus was found in tonsillar abscesses. He mentions, in conclusion, methods of disinfection, noticing a new form of paraformaldehyd candle which has been introduced, and says that the best results are obtained with the room nearly air-tight, using one candle to every 300 c.c. feet and arranging the surfaces of the articles so as to give full exposure, leaving the room for six or twelve hours, and using cleaning processes over the hard surfaces to supplement the procedure. Formaldehyd gas, while very diffusible, has slight penetrating properties. He says: "These facts demonstrate that to thoroughly disinfect a room and its contents, we should not depend solely upon formaldehyd, but that in rooms having glazed surfaces, china, marble, metal and the like, subsequent washing with solutions possessing recognized germicidal properties, as 5-per-cent. solution of formalin, 5-per-cent. carbolic acid, etc., should be employed. Thus, it is shown that while in formaldehyd gas we now have an efficient and harmless disinfectant for such objects as laces, plush, velvet, curtains, table-covers, hangings, and the like, when not of too heavy texture for which heretofore no satisfactory household method of disinfection had been devised, and while in many cases its action upon all objects may be efficient and satisfactory, and its action upon metals, picture frames, etc., harmless and non-corrosive, in cases of serious infection, in which it is possible that infectious matter, such as blood, saliva, sputum, feces, pus or urine may be dried upon wood floors, chamber-vessels, basins, washstands, glasses, metal bedsteads and other hard surfaces, its action should be supplemented by a cleansing and disinfecting solution possessing solvent and penetrating powers."

**24. The Gonococcus.**—The importance of the bacteriologic diagnosis of gonorrhea is insisted on by Bondurant and he thinks culture examinations in doubtful cases will amply repay for all the trouble. No one should treat urethral inflammation without making or having made an examination for specific disease.

**25. Aconite Poisoning.**—Magill reports a case of aconite poisoning which is of some importance as showing the possibility of demonstrating the presence of the alkaloid of this substance. There are few cases now recorded of aconite poisoning and in this one the amount of the poisoning for the first time could be positively determined. He says that to say, as has been said in recent years, that the combination of alkaloids in case of poisoning renders the toxicologic work impossible or its evidence valueless, is worse than pretense; it is ignorance. Throughout a long series of experiments they have yet to find an alkaloid they were not able to identify by these methods of animal administration and analysis, alone or conjoined with methods of chemical examination and control.

**26. Tuberculosis.**—Pottinger believes in the use of culture products in the treatment of tuberculosis as well as on its diagnosis, and disproves the idea that mere open air and change of climate is sufficient. Care without climate is better than climate without care.

**29. Alcoholic Psychoses.**—The mental disturbances from alcoholism are discussed by Beebe who takes rather the view that it leads to irresponsibility and that the inebriate is practically insane. He thinks we should preach the truth in regard to the action of alcohol and control the sale of the article: prevent the marrying of alcoholic subjects at almost any hazard, especially those whose intellects are involuntarily paralyzed by this agent, keeping them from propagating their species by shutting them up in well-organized institutions and building up as far as possible the damaged brain cells, before permitting their enlargement.

**36. Clinical Treatment of Inebriety.**—According to Crothers, inebriety is both a neurosis and psychosis and it is curable at some stage or other of its existence and at all stages can be checked. It requires the treatment for the conditions of poisoning, starvation and exhaustion. We should reach these conditions by elimination by the skin, bowels and kidney, brain and nerve rest, building-up treatment, mental and physical treatment and breaking up complications that have developed. We should study the exciting causes with the object of removing them or preventing or diminishing their power and influence. We should also consider the conditions that have grown out of the use of alcohol and the use of drugs to restore the patient and enable him to dispense with them in the future. The last point he mentions is the importance of individual treatment.

**39. Alcohol in Tuberculosis.**—Kelynaek points out the close relation of alcohol to tuberculosis, showing by testimony of the various authorities how the spread of alcoholic habits aids in the production of tuberculous disease.

**51. Cesarean Section in Placenta Previa.**—Schauta questions the value of Cesarean section in this condition and says that for many years he has used the method of bimanual version followed by the attachment of a weight of about three pounds to the fetal leg which is brought down through the vagina. The expulsion of the fetus, assisted somewhat by the continued traction exerted by the weight, is left to the natural sources until the umbilicus emerges from the vulva. From this point the case is managed in accordance with the usual method of dealing with breech presentations. A compilation of his cases during the past ten years shows a total of 234, of which 16 ended fatally. In some of these cases placenta previa could hardly be credited with the mortality. Even allowing this, however, the percentage, 6.8, is not a high mortality, especially in view of the condition in which the patients are brought to the hospital. The advocacy of Cesarean section in all cases, which necessarily includes all cases where the simplest opening of the amniotic sac suffices to stop the hemorrhage, hardly deserves serious consideration. \*He, therefore, limits his remarks to severe cases of central or total placenta previa. To replace version by Cesarean section in those cases would only add dangers to those already existing. The operation can not be at once performed even in well-equipped hospitals, while version is always available. Deep narcosis is necessary and there must be a certain amount of blood lost, for often copious hemorrhage can not be avoided. The placenta must be peeled off after removal of the fetus with the danger of uterine atony. He does not perform conservative Cesarean section in cases that were handled before entrance by untrustworthy people, provided the indication for operation is not absolute. Very few cases brought to the hospital conform to this indispensable requirement. The question whether the section promises to reduce maternal mortality in these cases, he thinks must be answered in the negative. As regards the chances of the fetus, he believes that they would be better if Cesarean section could be performed immediately on the appearance of the first hemorrhage, but if we look over the reports of cases we find only a small number of these

children are fully developed. In his 234 children, only 92 were matured and the mortality of premature children is much more in these cases because they suffer from asphyxia due to the partial separation of the placenta from the uterus, and, therefore, he holds that we would not obtain better results as regards fetal mortality by operation.

**53. Malarial Hematemesis.**—From experience in tropical practice, Fest finds that hemorrhage or black vomit is not so rare in severe malarial cases, and reports instances. The blood in these cases is loaded with plasmodia and pigmentation increases the coagulability. The brain, in a case examined, was studded with many fine hemorrhagic dots. The enlarged blood corpuscles blocked the lumen of the capillaries and the thrombosis ensued, causing coma. Hematemesis is caused by a similar process in the gastric mucosa. The convulsive contractions during the vomiting strains the engorged capillaries and they rupture. Cachexia is no necessary condition for the symptom. Treatment must be anti-malarial and he uses hypodermics of quinin so as not to lose time and to prevent more vomiting. Medication by the mouth must not be considered until the stomach is perfectly at rest. If the hematemesis has been extensive, normal salt solution should be injected; to prevent collapse, dilute the blood, and thus diminish the formation of capillary thrombi.

**57. Muco-Membranous Colitis in Children.**—Zahorsky concludes that muco-membranous colitis is a rare condition in children and that there is no evidence of its special existence in children excepting those in which the name mucous abscess can be applied. The pathologic process and clinical history is similar in children and adults and the term mucous disease should be dropped.

**58. Dysentery.**—Fisch describes the intestinal changes in amebic dysentery, consisting largely in colonic alterations, thickening, ulceration, the process involving the submucous tissue, ulceration formed by submucous degeneration which extends into the intra-muscular layers with proliferation of connective tissue and absence of exudative process in the ordinary sense of the word. The connective tissue increase does not lead to fibrous interstitial substance, but to a homogenous, clear-looking, gelatinous material; in later stages this becomes edematous. The peritoneum is involved, leading to adhesions, the mesenteric glands are swollen, liver abscess may occur and also necrosed areas in the liver. The lung may also become involved as he finds in one of his cases observed, the foci of softening, in the lung tissue, containing glairy, whitish red material with shreds of necrotic tissues intermixed and apparently without any indication or without any relation to bronchial lesions, but corresponding closely to those found in the liver and intestines. The lesions of bacillary dysentery have nothing in common with those described. The agglutination test is distinctive.

72.—See abstract in THE JOURNAL of February 15, p. 472.

73.—Ibid.

75.—Ibid., p. 473.

**76. Heredity.**—Krauss has investigated the subject of heredity as shown in the statistics of the New York asylums for the insane for the years 1895-96 and 1898-99 and also for the whole period since Oct. 1, 1888. He finds that taking cases only where data can be obtained, the percentage of heredity was in 1895-96, 39.2, in 1898-99, 41, which was very nearly the percentage for the whole period since 1888. These percentages vary largely in the different hospitals, some showing very much greater proportions than others. They indicate that maternal transmission is increasing rapidly over paternal transmission in cases of the insane in this district.

**78. Indican, Acetone and Diacetic Acid in Insanity.**—Coriat's article is an elaborate clinical paper reviewing the subject of indicanuria, acetonuria, etc., in the insane. He finds that it has been observed that the elimination of indican is greater in depressed and akynetic cases, but he does not see the reason to believe it due to intestinal auto-intoxication. Its origin is obscure and the significance can not be determined

or even hinted at without further study. We must first know more about the physiologic and pathologic chemistry of the various psychoses. As regards acetone and diacetic acid, the results are also inconclusive. He thinks their appearance may be referred to abnormal metabolism due to inhibition processes. He has not been able to detect the relation of acetone to fear, as pointed out by Marro. Auto-intoxication as a factor in producing akynetic conditions clinically manifested by the presence of acetone or diacetic acid in the urine, can, he thinks, be definitely ruled out.

**85. Typhoid Fever.**—Tomlinson gives a history of the experience in the insane asylum at St. Peter's, with this disease, which seems to be almost endemic there, appearing in the fall for a number of years in succession. Its source has been rather mysterious; the water and milk supply can be safely excluded. The recent experience of one of the nurses shows a possible source. A patient who had been in bed for some time and who was very filthy and destructive began to have fever and the nurse was apparently infected from this individual. He holds that the specific bacterium may exist in the intestines without causing the disease; that the source of infection has been present in the hospital for many years and that from time to time fresh infection takes place from patients or employees who have had an unrecognized attack of typhoid fever, or may be the immune carriers of the germ. In the time of overcrowding and when there are many destructive and filthy patients together, there is likely to be recrudescence of this state. The principal means of contagion are undoubtedly the hands and clothing of the patients and nurses by which the milk or food are contaminated or the patient infects himself from his own excreta. He warns that it is possible for a person to be infected with the bacillus of Eberth and carry it in the intestinal canal for an indefinite period of time, without sufficiently multiplying the bacilli to give rise to symptoms and then under the influence of some of the causes above mentioned, the contents of the intestinal canal become a medium of infection, and the lowered vitality admits of its rapid proliferation and resulting general infection. All the cases developing in the hospital, apparently *de novo*, have had a history corresponding to these conditions.

**86. Carbuncle of the Upper Lip and Face.**—This condition is described by Moore, who reports several cases. He does not believe that the conservative or expectant treatment is applicable excepting in those cases where the disease is so situated and is so mild that the natural tendency is to recovery. It is never indicated when the disease is on the upper lip or face. In this location it has had a mortality of 50 per cent. and is not to be trifled with. After thrombosis and embolism has occurred all treatment is hopeless. For cosmetic reasons early operation is also advisable.

**89. Cold Friction.**—Leadsworth advocates under this name a procedure which consists in the application to the surface of a body of a series of wet rubbings on one part after another, taken in systematic order until the whole surface has been vigorously reactive. The application is graduated by temperature and the degree of saturation of the mit which may be made of some rough material, a close-woven woolen cloth resembling haircloth being the best. He thinks this is indicated in all cases requiring tonic application; it is invaluable in neurasthenia and it affords the best of all means for training patients to endure the contact of cold water with the surface. It can be advantageously employed in anemia, chlorosis, tuberculosis, post-febrile convalescence, cardiac dropsy, anasarca from kidney disease, chronic toxemia accompanied by spasm of the peripheral vessels, cardiac inefficiency and wherever cold in any form is indicated. It is specially indicated, he thinks, in chronic disease where there is general torpidity of the bodily functions.

**97. Pneumonia.**—Maschke has experimented on cats and rabbits and concludes as follows: "The pneumococcus damages the circulation in the rabbit by paralyzing the vasomotor centers in the prolonged cord. This vasomotor paralysis leads to a fall in the arterial pressure, and causes, further, a changed

distribution of the blood in the organism. The splanchnic vessels are overdistended, those of the brain, muscles and skin, empty. The heart is not concerned in these disturbances and is only damaged in consequence of its own deficient coronary circulation, which is secondary to the vasomotor paralysis. Romberg, as above stated, found in the hearts of patients dead from croupous pneumonia just as slight pathologic changes as were evidenced in the hearts of the infected rabbits. The close correspondence between these experimental findings and the clinical and postmortem findings in croupous pneumonia in the human subject makes it extremely probable that these deductions apply *in toto* to the human, provided we can disregard the factor of mechanic obstruction." He says, aside from minor factors, the sum of our knowledge of the state of the circulation in pneumonia is as follows: "The deleterious action of pneumonia on the circulation is primarily due to the accompanying toxemia, not to fever *per se*, but may possibly be secondarily somewhat influenced by the mechanic obstruction. The toxemia produces this circulatory depression, not by poisoning the heart or the heart-centers and nerves, but by directly poisoning the vasomotor centers in the prolonged cord and thus producing a vascular dilation. The heart is only affected late in pneumonia, and then because of its own deficient coronary circulation brought about by the abnormal distribution of the blood-supply."

**98. Treatment of Pneumonia.**—The various remedies used in pneumonia are reviewed by McGee. Quinin has been practically discarded as an abtective agent and of the cardiac depressants, veratrum viride is probably the only one administered with this end in view, and this only to a very limited extent. In fact, the use of cardiac depressants is generally condemned by the profession in this disease. Alcohol is a drug of uncertain status, but it is of the greatest value when given with judgment, though not as a routine remedy. In the asthenic and elderly, in the alcoholic and in the presence of toxemia with a weak heart and nervous symptoms, when well-borne, it is of the greatest value. In bronchial pneumonia; especially in children, it can be used with benefit. In some cases of pneumonia with very slight lung involvement, but with extreme toxemia, alcohol is often of value, as aiding the patient in resisting infection. Nitroglycerin may be of some use in the case of cyanosis, but he doubts its value, as a rule. Death in pneumonia often occurs from heart failure, hence the use of strychnia, which is more used as a routine practice than probably any other drug. As a respiratory stimulant it excels and it is a real stimulant for all the medullary centers. Its use should be reserved until the condition calls for it, and then given in full dose, 1/30 or 1/20 of a grain, given every few hours. Digitalis is advisable to support the heart in some cases, but the medium dose is the best and given at long intervals. The creosote derivatives have been highly praised of late. Carbonate is the form probably most used. He has used guaiacol carbonate in 5-gr. doses every few hours for sometime past and apparently with benefit, so that he gives it now almost as a matter of routine. It apparently has an antiseptic effect upon the pneumococcus or its toxins and it may produce an antipyretic effect. The serum treatment of pneumonia is still in the experimental stage but deserves further trial. Normal salt solution is sometimes of value in facilitating elimination. Remedies such as opium and oxygen may be required for special indications, but not to cure pneumonia in a specific sense.

**102. Irregular Pulse.**—Patton finds that irregular pulse is not usually an invariable manifestation of myocarditis or myocardial disease; nor is it a usual manifestation, and that the degree of irregularity has no relation to the extent of the myocardial involvement. The symptom has no special indication *per se* in relation to insurance examination other than to demand investigation of its cause, particularly as to the presence of cardiac, cardio-vascular, or nephritic lesions, the presence of which may be indicated by such irregularity, but just as frequently is not.

**111. Insomnia.**—Skelton groups the causes of insomnia into the following: 1. The interference with the normal with-

drawal of stimuli. Irritation of the sensory nerves. 2. Irritation of the visceral organs. 3. Over-activity, irritable exhaustion of the cerebral neurons. 4. Intoxications of cerebral neurons. 5. Hereditary unbalanced and irritable neurons. The employment of narcotics is the most irrational treatment, as in most cases of insomnia a toxemia is present and the toxic factor is often so prominent as to force itself on the attention. It is not necessary that afferent sensations should be consciously appreciable to produce insomnia. The treatment consists in the management of the clinical condition and he outlines in a general way his experience as follows: 1. The induction of muscle fatigue by walks in the open air or by massage. Many people can not sleep because their muscles are not tired and their nervous system is over-excited. 2. The clearing away of intestinal and hepatic accumulations by sulphate and salicylate of soda, combined or not with citrate of potash and lithia. This diminishes auto-intoxication and irritation from distended viscera and aids the circulatory equilibrium. 3. The giving of a proper amount of easily-digested food. 4. The use of a hot bath. 5. Proper sleeping rooms, where seclusion can be had; the victim of insomnia should sleep alone. As regards the action of hydrocarbons, hypnotics and narcotics, we should remember that they interfere with normal metabolism and are purely symptomatic in their usefulness, and have objectionable secondary and side effects, and are used only because of ignorance of the underlying cause of the symptoms, of our inability to control these causes. In a general way we may formulate the indications for their use as follows: Insomnia from pain: Morphin, coal-tar products and large doses of chloral. Insomnia from delirium and reflex irritability: Chloral, trional, sulphonal. Insomnia from delirium and chronic insanity: Hyoseyamin, combined with morphin. Insomnia from "nervousness," "worry": Bromids, given in sufficient doses—twenty grains three or four times in the daytime—is incomparably the best and safest hypnotic. It is to be recollected that morphin increases reflex irritability. The chlorals depress the medulla and are dangerous in heart and vascular diseases, lung, kidney and stomach irritability. Sulphonal and trional cause nephritis.

117. **Abdominal Aneurism.**—Browning reports three cases treated by rest, restricted diet, administration of gelatin, iodid of potash, etc., with good results.

121. **Ovarian Transplantation.**—Morris calls attention to a matter of priority. His first publication on the subject of ovarian transplantation was several months ahead of that of Knauer, and he attributes Knauer's work and publication to the fact that one of his assistants when in Europe talked about his experiments there and found a great deal of skepticism manifest. He thinks this is parallel with other facts. He had demonstrated in Germany how moist blood clot could be utilized by surgeons before publishing his paper on the subject and on his return to this country found that a German surgeon who had been most skeptical had secured priority of publication and the method is now known by his name only.

141. **Cold Abscess.**—The management of this form of tubercular disease is summed up by Townsend as follows: 1. Carefully treat the joint disease. 2. If abscess appears, endeavor to keep it sterile. 3. Aspiration, unless there is some indication for incision. 4. If the abscess is sterile and incision is decided on, do so under strict aseptic precautions. 5. If abscess becomes infected, open at once. 6. Use sterile water or sterile salt solution for cleansing the cavity, in both the sterile and the infected cases.

146. **Glaucoma.**—Coburn has experimented to induce glaucoma in animals by studying the course of the lymph streams in the anterior segment and endeavoring to affect them, studying the effect of increased pressure on the anterior and posterior chambers, by experiments with the results of introduction of foreign material into the eye, and with the indirect introduction of substances through the circulation and the closure of channels of exit by affecting the changes in the ciliary region and aqueous. The animals employed were cats and albino rabbits. The summary of the results is as follows:

1. Intraocular changes may be induced by deleterious substances in the circulation. 2. The effect of irritating material in the circulation induces, first, congestion of the ciliary body and iris and then vesical formation in the ciliary region followed by fibrinous exudate into the anterior and posterior chambers. 3. Fibrinous and albuminous exudates have a predilection for the anterior chamber, depositing or forming on the anterior surface of the iris and in Fontana's spaces. 4. These deposits, usually accompanied by deep anterior chamber, block up the exit at the angle and increase the tension. When the irritation is brief the exudate may be absorbed and the tension return to normal. If the irritation is sufficiently prolonged or intense, glaucomatous iritis with its attending evils may ensue. 5. The cause of glaucoma is apparently some lesion which pushes the iris and lens forward, making the anterior chamber shallow and blocking the exits at the angle with the root of the iris. This cause is to be found in the ciliary body and processes. He remarks that while these experiments have not added directly to our knowledge of the cause of glaucoma, they have thrown new light on the functions of the ciliary body and iris and on the conditions in which serous and fibrinous iritis and eyelitis occur, showing that the intracocular circulation of certain substances is quite sufficient to produce these diseases. Therefore, the constitutional element should not be disregarded in their treatment.

148. **The Visual Field of Glaucoma.**—Variations of the visual field in glaucoma as studied by Bunge, Bjerrum and others are reviewed by Friedenwald, who concludes that Bjerrum's view that the defect is due to interruption in the course of the nerve fibers as they pass through the excavated portion of the papilla is best corroborated. He finds no correspondence whatever between the defect and the course of the arteries, and he is convinced that however important the sclerotic changes in the vessels may be in the pathology of glaucoma, they are not the cause of the interesting forms of field defects as first described by Bjerrum.

1. **Myasthenia and Ophthalmoplegia.**—Gowers calls attention to a peculiar facial expression which he calls the nasal smile, as characteristic of the myasthenic cases. Its features are absence of normal movement from the corner of the mouth, which either carries the furrow from the nose around the corner of the mouth or produces a separate depression there. Loss of power in the eyeball muscles is also a symptom of myasthenia which has not been fully recognized and which is prominent in three cases here reported. It resembles at first sight the ophthalmoplegia from nuclear degeneration, but there are differences; one the great escape of muscles moving the eye downward and the implication in various degrees of those moving the eye-

balls upward. The constant and irregular action of the lateral muscles was most incomplete, showing remarkable variations in the different periods. In all cases the light-reflex of the iris was perfect and he thinks this is the rule. Accommodation seemed to be impaired in two cases. Ptosis was a marked feature. The two features of "nasal smile" and ophthalmoplegia are the ones to which he wishes to call attention and the significance of the fact of the former that it corresponds more closely to that in idiopathic muscular atrophy than to known affections of the nervous system. The distribution of symptoms in the muscles is also more analogous to muscle atrophy than to central nervous disease, but the ophthalmoplegia from its resemblance to the nuclear form is more suggestive of central disorder. The microscope gives very little revelation as regards the nature of this affection. The definition of the trouble, nutritional disorder impairing the vital processes in the muscles, is little more than the statement of the symptoms. The toxic theory of the disease is considered by Gowers to have very little positive evidence in its favor and little benefit seems to have resulted from treatment.

**6. The Diazo-Reaction.**—Syers has investigated some 125 cases of typhoid with the diazo-reaction and finds that no striking practical points of value are shown and, according to him, it is of little value. In the early stages it gives a negative result, and when the reaction is positive the disease is usually so far advanced that there is no question as to the diagnosis. He thinks we overvalue laboratory tests.

**8. Lunacy Administration in England.**—The history of lunacy administration for the last thirty years is reviewed by Shaw, who notes the advances that have been made, perhaps not so much in the proportion of cures as in the better management of patients, thus lessening the number of accidents. He lays much of the comparatively easy management of the insane of late years to the disuse of stimulants both on the part of the patients and the attendants. Another reform which has come into vogue of later years is undivided authority in asylums, giving the medical superintendent more complete power; another seems to be clinical instruction in insanity; and still another the accommodations for the insane, which are greatly improved. The patients are more comfortably and sanitarily managed. As regards the results in the statistics of cures and deaths we must wait. He thinks it would be a good idea to have a temporary detention hospital for acute cases thoroughly equipped with a complete visiting staff of neurologists and specialists. He speaks rather favorably of the utility of surgery in insanity, especially operations on the brain. The home management of the insane he does not look upon with favor. Asylum statistics are not considered by him as on a whole specially valuable, some of the tables being valueless, others being misleading. Heredity, he thinks, is over-estimated, and in conclusion he insists on the close connection between the studies of neurology and insanity, which at present in Great Britain are almost divorced.

**11. Chloroform and Ether.**—Crouch and Corner believe from their statistics, which cover more than 3000 anesthetics in the St. Thomas Hospital, that ether in its way is less safe than chloroform. There were ten cases of respiratory complications, all from ether administration, the patients all having been in good condition and the anesthetic being given under favorable conditions by the house officers. All were trunk cases, and such as required bandaging, that of necessity restricted the chest and abdominal movements. In one case of broncho-pneumonia the outcome was fatal. In 600 patients who had chloroform none developed any respiratory trouble. They, therefore, recommend chloroform in all long operations on the trunk. All the cases had the preliminary administration of nitrous oxid and they think from their analysis that the ether was more or less responsible for the complications. In a postscript they speak also of two cases of death during anesthesia, one from ether and one from chloroform. In neither case did they credit it to the anesthetic. They strongly recommend changing the anesthetic to chloroform after ether has been given to the patient for a time.

**21. General Paralysis in Twins.**—The case described by Keraval relates to twins, married men, with no known personal or hereditary morbid antecedents nor abuse of liquor. They did not live together. Both developed typical general paralysis, one at the age of 39 and the other at 47, thus eight years apart, and in each it assumed an exactly similar form (*délire de négations*). The clinical history of each reads precisely the same, the same ideas, expressed in the same phrases, with the same reactions and the same evolution.

**23. Prevention of Accidents from Use of Chloroform.**—The JOURNAL has described at various times Laborde's method of resuscitating in cases of apparent death by rhythmic traction of the tongue, and the physiologic processes on which it is based. The method was first worked out to reduce the laboratory expenses from the number of dogs that died under chloroform in the experimental researches. It has since been applied in innumerable cases of apparent death in man and animals and has proved wonderfully successful, especially in chloroform mishaps. Laborde in this communication studies the physiologic processes involved in general anesthesia and preclaims that it is the surgeon's duty to suppress the primary, reflex functional arrest of respiration caused by the intensity of the patient's emotion, or by irritation from the fumes of the anesthetic, or by both combined. This is easily accomplished, he asserts, by a preliminary injection of some analgesic or by local cocaineization. He prefers a combination of 10 eg. of morphin hydrochlorate; 5 eg. of atropin sulphate, which is a physiologic-toxic but not therapeutic antagonist of morphin; 1 gm. of spartein sulphate, which has a direct stimulating action on the heart muscle, with 10 c.c. of distilled water as the vehicle. Of this, a dose of 1 c.c. is sufficient. This preliminary injection prevents all danger of primary functional arrest of respiration. It should invariably be supplemented by applying special traction forceps to the tongue so as to be ready to practice rhythmic traction at the slightest suspicion of trouble. The forceps should be placed on the tongue at the commencement of the anesthesia. He thinks that surgeons who fail to take these precautions are directly responsible for the accidents that are liable without them. He has the assistant smooth the chest with slow rhythmic friction as a soothing measure to tranquilize the patient.

**24. Valvular Affections Induced by Muscular Effort.**—De Quervain observes that while these affections are less frequent than what he calls traumatic lumbago and "force hernia," yet they are assuming great importance in these days of increasing industrial insurance. Several recent Paris and Berlin theses have been devoted to this subject, founded on personal observation of such cases, and De Quervain adds another to the list. The records demonstrate that a predisposing cause was apparent in nearly every instance, some acute infectious disease or arteriosclerosis, nephritis, gout, syphilis, or some chronic intoxication as from alcohol. *Tabes* seems to afford a peculiar tendency to laceration of the aortic valves. But it is possible that a violent effort might injure a sound heart in this way. The effort was a sudden movement to avoid a fall, or the exertion of lifting a heavy weight, with or without the basis of exaggerated continuous muscular exertion. The left heart was almost invariably the site of the injury. It did not affect the mitral valve itself in 12 cases reported by Dreyfuss, but merely the chordæ tendinæ or the columnæ carneæ. In several cases vegetations were scattered on the lacerated fragments and on the valves, but it was impossible to determine whether these were primary or secondary to the injury. The aortic valves were involved twice as frequently as the mitral. In the personal case described the subject made a sudden, violent effort to prevent the fall of a large cask of wine he was unloading. He was 35 years of age, previously healthy, with no morbid antecedents except a few alcoholic excesses several years before. He felt as if he had been struck in the chest with a whip and had immediate epistaxis, followed by gradual cyanosis, rapid pulse and constant distress. In three weeks an intense and harsh systolic souffle was audible over the mitral valve, and the patient died

with symptoms of infectious endocarditis and cerebral embolism seven weeks after the accident. The autopsy showed recent endocarditis and laceration of chordæ. The prognosis of such lesions is generally unfavorable, and they materially impair the working capacity if the subject survives. The diagnosis is based principally on the sensations at the time, the rapid development of cardiac disturbances and the more or less pronounced hemoptysis during the first few days. The development of infectious endocarditis later is a point in favor of the traumatic origin of the trouble, if the subject had no suppurative affection at the time inducing a special predisposition to endocarditis.

**25. Gauze Veils for Aseptic Operations.**—This communication from Witzel's clinic describes a headgear which is a combination of cap, mask and beard protector in a single piece. It is merely a square of gauze, or a piece 80 cm. long by 50 wide. The gauze is folded between the first and second third and a slit about 30 cm. long is cut in it. A strong thread is fastened at each end of this slit or a couple of tapes sewed on. The gauze is then thrown over the head, bringing the slit opposite the eyes. The tapes or threads are then tied at the back of the neck and as the large apron is put on, the loose edge of the gauze in front is tucked loosely into the neck of the apron. The head, face and mouth are thus completely covered and only the eyes left exposed. The gauze is so light and the entire contrivance is so loose that it causes no discomfort even on the warmest day, while it guarantees absolute asepsis as the gauze can be easily sterilized folded in a towel. Witzel makes the square out of three layers of gauze, although two layers might be sufficient, he observes. He does not use gloves in aseptic operations as he thinks that scrupulous avoidance of infection is the best means of ensuring asepsis, but considers a head covering an absolute necessity.

**28. Treatment of Ileus with Preparations of Belladonna.**—By grouping and tabulating the results of the treatment of ileus with atropin in the published reports, Honigmann shows that failure is inevitable in case of "strangulation ileus" or incarcerated hernia, and the procedure is directly injurious in such cases. On the other hand, it sometimes proves very effective in cases of ileus from occlusion as also in any dynamic or functional interference with the permeability of the intestines. The effect of the belladonna preparations is essentially sedative. No data have been recorded as yet which indicate that they are capable of stimulating the movements of the intestines. The soothing effect of atropin in subcutaneous injection is frequently apparent after even a small dose, not more than .5 to 2 mg., but in other cases not until after repeated and larger doses. The single dose of 5 mg. recommended by Batsch should never be given to start with. It is better to commence with .5 mg. doses to test the individual susceptibility. People over 50 display evidences of intoxication after small doses more than younger subjects with large doses. Atropin does not seem to possess any particular advantage over opium, while it has the disadvantage of easily inducing symptoms of intoxication. It should, therefore, be administered only in case of the failure of opium. When the injection of atropin has not produced the desired effect in the first two days, in the passage of flatus and stools, the euphoria following its use should not delude the physician or patient into further delay of the necessary surgical intervention. Only in those cases in which an operation is absolutely refused or is impossible for any reason, should the atropin treatment be longer continued.

**29. Surgical Complications of Influenza.**—Ruhemann has been able to collect one hundred communications on this subject. They show a remarkable range of post-influenza affections which includes ulcerative stomatitis, general osteomalacia, suppurative parotitis, abscesses in lungs or throat, gangrene of the lungs, epididymitis and orchitis, pyemic joint affections, thrombosis, tendency to hemorrhages and surgical affections of the eye and ear. Franke has observed a number of nervous affections on a neuritic basis which simulated surgical lesions and led to mistaken intervention, as for instance, neuritis of the intercostal and lumbar nerves which simulated peritonitis

or appendicitis; neuritis of the axillary nerve which simulated rheumatism of the shoulder, and of the obturator nerve simulating a knee affection. Ruhemann concludes by warning against undertaking any surgical intervention not indicated by some complication of influenza, during convalescence from influenza or during the prevalence of an epidemic of la grippe. Demons has especially urged to refrain from surgical intervention on the upper air passages during recovery from influenza as the danger of suppuration has impressed him as particularly imminent at such times. By this precaution it is possible to avoid the pyemia liable to occur in such cases, so puzzling for the surgeon who overlooks the cause in the latent influenza infection.

**33. Practical Method of Prophylaxis of Gonorrhea.**—Fermi reaffirms the great advantages of his simple and practical method of curing gonorrheal infection in men. It is absolutely harmless and secures more certain and permanent cures than other measures in vogue while its action is so prompt that it can be called abortive. He uses a bulb syringe with which he injects about 100 to 200 c.c. of a 1 per 2000 solution of permanganate, or of 1 per 5000 solution of nitrate of silver, or 2 or 3 per 1000 solution of protargol. The fluid is forced into the urethra and then aspirated again into the bulb, re-injected and reaspirated a number of times in succession, which only requires a few seconds. The bulb full of the re-aspirated fluid is put in its small metal box and slipped into the pocket. The procedure is repeated three times a day, but the total time spent on it is not more than twenty or thirty minutes. The same fluid is used over again each time during the day, which renders this method of treatment easily practicable. Nothing has to be carried on the person excepting the bulb syringe. The inflammation is reduced by keeping the penis wrapped in a strip of gauze 50 by 8 cm. applied very loosely and held by two bands around the trunk. It is moistened three or four times a day with cold water without removing the bandage for the purpose. Both rinsing and the application of cold water should never be neglected before retiring. The fluid used first in the morning is thrown away. This method has been applied on a large scale in the Italian army and has proved superior to all others, it is stated.

**36. Improved Technic for Stethoscopy.**—Reichmann's improvement consists in a round stick about 7 cm. long by .5 cm. in diameter. It is grooved with a screw thread and the fingers are rubbed up and down on the stick held perpendicularly on the skin while listening through a stethoscope. The sound varies with the organs beneath and the information thus obtained is proving surprisingly accurate and valuable. The technic was described in THE JOURNAL of December 14, 1901, p. 1642. In his present communication Reichmann corroborates the importance of this "Stäbchen-Auskultation." The sticks can be made of wood, ivory, rubber or bone. He prefers the latter. It serves better than any other measure at our disposal to determine the size and the outlines of internal organs and their position in regard to each other, but it imparts no information in regard to the normal or pathologic structure of single organs.

**37. Diagnostic Significance of Tuberculin.**—Bandelier is chief of the Cottbus sanatorium for pulmonary diseases. He applies tuberculin when the patients leave, as a means of determining the thoroughness of the clinical cure. He has found that 60 per cent. of all the patients no longer react to a dose of 10 mg. of Koch's old tuberculin. He does not include in this list those who were treated with tuberculin, but merely those for whom it was applied as a diagnostic measure. He urges others to adopt it as the most reliable means of early diagnosis and as the most certain means of determining the extent of the cure.

**39. Improved Technic for Microscopy of the Feces.**—Cohnheim recommends for the purpose of obtaining a scrap of feces for microscopic examination, a small instrument which consists of a stout glass tube about seven inches long, terminating in a small hollow olive provided with a fenestra. It can be readily inserted in the rectum, and fluid feces fill the

bulb at once, while by twisting the tube in the fingers, the fenestra scrapes into the bulb a small plug of feces if they are solid. The little instrument is easily cleaned and disinfected by forcing water through it from the open end of the tube. By its use the physician can usually obtain at any moment sufficient feces for the microscope while the patient is spared the inconvenience of bringing it in some receptacle to the office. Another advantage is that infusoria can be inspected alive while they are always dead by the time the feces derived in any other way reach the microscope.

**40. Chlorinated Lime in Treatment of Ulcus Cruris.**—Zeuner's experience with a hundred cases of ulcer cruris treated with a 1 per cent. filtered solution of chlorid of lime, has convinced him that this simple, old-fashioned remedy is the most effective of all at our command. He applies it on several thicknesses of gauze and then wraps the leg in a tricot bandage, commencing at the toes. The purulent secretions dry up almost at once; the lesion presents a clean granulating surface and the formation of skin is exceptionally perfect. He has found it also an excellent means of treating infected wounds of the tibia.

**43. Hydrotherapy of Tabes.**—Munter describes the scientific basis for hydrotherapy of tabes in its effect on the normal supply of blood and the course of the nerve stimulus. The function of the nerves is remarkably influenced by the blood supply, as he demonstrated some years ago by his experiments on tendon reflexes in dogs. Compression of the abdominal aorta, even for a few seconds, suspends the tendon reflex, and it reappears again as soon as the normal flow of blood is restored. The blood vessels are not found much altered in tabes. Cases of tabes have been observed in which the abolished knee-jerk returned after the subject had become hemiplegic, and on the affected side. This indicates that even in degenerated nerve fibers the intact remainder can be stimulated to increased function. These and similar facts which he cites suggest a basis for successful functional and nutritional influencing of the nerve elements by thermic stimuli and hydrotherapy in general. His experience has shown that the most effective means of treating the attacks of pain is with a bath of forty-five to sixty minutes, at a temperature of 95 F., with or without the addition of a little salt ("1 per cent. Sool"). The temperature is kept at the same point and all irritation avoided, the patient afterward returning directly to bed. This bath serves as "practice" for the nerves, while the brief application of cold has a tonic, stimulating and strengthening effect on the nerves. Tabes induces a peculiar sensitiveness to cold and its prolonged application is almost certain to cause recurrence of pains. He therefore warns against a temperature less than 85.5 F. except for a brief dash of quite cold water for five to ten seconds and no more. He describes his method of applying these therapeutic measures, modifying them to the individual case and promoting reaction in every way after the tonic baths. He advises the baths once to three times a week, continuing them for a year or longer, instead of crowding a large number into a short space of time. Electric, Faradized water baths have also proved useful, but he rejects as injurious steam, sand and electric light baths. If a sweat bath is needed dry heated air is the best for tabes. Even in advanced cases these hydrotherapeutic measures may benefit and can do no harm if all tendency to induce hyperfunction is carefully avoided. By the combination of hydrotherapy with the usual measures it may be possible to arrest the degenerative process and provide a substitute for the lost fibers by training the remaining intact elements.

**IBID.**—Eulenburg approves of Munter's statements in general, and in particular of his denunciation of baths below 85.5 F. even of carbonated waters. But at the same time he states an exception should be made for the local application of cold along the spine in the form of "Chapman's back tube," or some similar contrivance. He has been using them for thirty years and found them extraordinarily beneficial in the local and violent radiating pains of the early stages of tabes. He commends these appliances as a convenient and effective measure too little appreciated as yet. They can be used at home while most hydrotherapeutic measures require a special equipment. He

concludes by protesting against the use of the term "pseudotabes" which is so currently employed. He thinks that it is merely a cloak for "pseudo-diagnostic uncertainty or incompetence." Certain cases of syphilis of the spinal cord present the clinical manifestations of tabes, but it is a syphilitic affection and requires antisyphilitic treatment. Neurasthenia is sometimes erroneously diagnosed as tabes, and neurasthenic tabophobia is of even more frequent occurrence. None of these should be labeled "pseudotabes."

**44. Intermittent Hydrarthrosis.**—Burchard describes a case of idiopathic intermittent hydrarthrosis. The attacks corresponded to some extent with the menstrual periods and vanished during pregnancies. They also alternated with attacks of bronchial asthma, one substituting and excluding the other. Fifty-seven cases have been recorded in the literature and 41 out of 55 were idiopathic. Spontaneous cutaneous hemorrhage may occur in the course of intermittent hydrarthrosis. The records seem to indicate that the vascular system in such persons is exceptionally unstable, actual vasomotor ataxia.

**46. Pathology and Surgery of Gallstones.**—Merk reviews the experiences of the various Heidelberg surgeons, which include 128 cases since the last report was published. He concludes from them and other data that the formation of gallstones is an occurrence which happens only once during life. Complete removal of all the stones is followed by the permanent cure of the trouble. This operation is simple and free from danger in the early stages of biliary lithiasis, so long as the stones remain in the gall-bladder, which is almost exclusively the seat of their formation. But when the stones have once passed into the lower biliary passages the prospect of a radical cure with a single operation diminishes with the increasing difficulty and danger of the intervention. The disturbances and lesions which they have caused have then to be taken into account. The operations reviewed were performed by Czerny, 85; Jordan, 17; Marwedel, 20, and Petersen, 6.

**47. Metastatic Kidney Abscesses.**—Jaffe reports five cases of abscesses in the kidney in men. The staphylococcus was derived from four of them. They were metastatic to a furuncle on the neck in two cases, to a parotitis, a carbuncle or an abscess in the tonsil in the other patients. The interval in the latter case was four weeks. The symptoms were deceptively slight. Fever did not appear until that from the primary lesion had vanished. A chill was the first sign of trouble. Pain in kidney region was not noted until several days after the febrile temperature. The abscess in the kidney healed rapidly after nephrotomy in all except one case. This was a debilitated man of 55 with gonorrhea. The renal lesion recurred and required nephrectomy as the last resort, to which the patient succumbed.

**49. Artificial Gall-Bladder Intestinal Fistula.**—Radsiewsky has collected 56 cases and tabulates the details of the reason, operation and results. They show that the fistula is not in itself a source of danger in the sense of infection of the walls of the biliary passages or of the liver. But the walls of the biliary passages become dilated and thicker, with neoformation of lymph follicles in the hypertrophied mucosa of the gall-bladder. Microbes also find their way far into the liver and the biliary passages display a mild catarrhal condition. Retention of the contents of the biliary passages causes serious consequences. The prognosis depends mainly on the underlying affection.

**50. Kidney Affections and Pregnancy.**—Fekling mentions that eclampsia has occurred in his experience in only 5 per cent. of his patients with "pregnancy albuminuria." The prognosis of "pregnancy kidney" is usually favorable in the absence of eclampsia and premature detachment of the placenta. The latter is almost invariably fatal for the fetus. In case of chronic nephritis pregnancy should be prevented. If a pre-existing chronic nephritis becomes much aggravated during a pregnancy the family physician should consult with an obstetrician as to the advisability of inducing premature delivery.

**51. Infantile Stenosis of Pylorus.**—Trantenroth has been studying twelve cases of stenosis of the pylorus in nurslings.

Five entailed a fatal termination. He concludes that organic stenosis can be cured only by operative intervention, and that the functional nature of the stenosis is no contraindication to an operation, as it is absolutely impossible in most cases to distinguish between these two forms.

**55. Furuncles as Source of Paranephritis and Pyonephrosis.**—Cahn describes three cases in which a paranephritic abscess formed soon after the healing of a furuncle. Busquet has described a similar case. Cahn also reports a paranephritic abscess apparently spontaneous but finally accepted as traceable to a preceding follicular tonsillitis. No cause could be discovered in a fifth case. All were accompanied by delirium and severe general symptoms and all were promptly cured by evacuation of the abscess. He has known of instances in which osteomyelitis or joint suppurations followed furuncles on the skin, and concludes with the history of a case of protracted renal lithiasis in which suppurative pyelitis suddenly developed consecutive to a furuncle. This is the only case in his experience in which a suppurative pyelitis developed that did not have its origin in the bladder.

**57. Influencing the Liver by the Diaphragm, and Liver Massage.**—Walz analyzes the effect of deep inspiration and expiration on the liver and asserts that both have a powerful effect in stimulating the circulation in the liver. Moebius first called attention to this means of influencing this organ and semi-facetiously entitled it "massage of the liver." Forced expiration has a marked effect on the emptying of the gall-bladder. De Frumerie has recently published a systematic study of actual massage of the liver. He states that direct massage stimulates the extrahepatic circulation and reduces the congestion in the portal veins. It also stimulates the functions of the liver cells in acute and chronic insufficiency of the organ. He witnessed the disappearance of sugar from the urine in certain cases of diabetes, also improvement in gout and in passive congestion of the organ in cardiac affections and in malaria, and in certain cases of catarrhal icterus and gall-stones after the acute attacks were past. Direct massage is contra-indicated, he states, in case of carcinoma, fatty cirrhosis, amyloid degeneration, echinococcus or abscesses in the liver. He observed hemorrhage and cardiac collapse after too abrupt application of the massage. Moebius' respiration massage, on the other hand, is entirely harmless.

**58. The Need of Food at High Altitudes.**—Ranke has been making a study of the effect of climate and temperature on the nutrition. He finds that in the tropics there is a conflict between the heat generated and the metabolism and strength. The reverse occurs in the cold of high altitudes. All the vital processes are stimulated instead of being depressed and the metabolism as a whole is promoted in every direction.

**59. Foreign Bodies in the Uterus.**—Hermann has observed two cases of hairpins in the uterus. One patient was a girl of 15 and one a woman of 32. He reviews 21 other cases that have been published and concludes that foreign bodies may remain in the uterus for a relatively long period without causing severe trouble. They seldom induce septic processes. The foreign body is usually a fragment of a hairpin, and it is easily overlooked in the investigation unless the dull curette is used. Eight cases are on record in which a pessary slipped into the uterus from the vagina.

**66. Atmocausis Uteri.**—Hammerschlag reviews the results of the application of steam to the interior of the uterus in forty-four cases. It proved, to say the least, fully as effective as enuretting and it succeeded in many cases where the latter failed. It was the direct means of saving life in a few instances of hemophilia. It is especially effective in preclimacteric hemorrhages and in hemorrhage from a myomatous uterus. He does not approve of any local treatment of puerperal affections and states that inflammatory processes in the vicinity of the uterus are a direct contra-indication for atmocausis, as also deformities of the organ. It may serve to induce artificial sterility by obliteration of the uterine cavity. Successful cases of this kind have been reported.

**70. Blood Pressure in Chronic Nephritis.**—Von Czyhlarz examined twelve patients with chronic nephritis in regard to the blood pressure during the course of treatment. He found that in every case the blood pressure diminished, although no symptoms were apparent which indicated weakness of the heart. This decrease in the blood pressure is evidently connected with the improvement induced by the rest in bed, etc. As the headache, vertigo and other subjective symptoms vanished with the lower blood pressure, he is inclined to consider them—to some extent, at least—as directly due to the high blood pressure.

**71. Differential Diagnosis of Pleuritic Effusions.**—Koranyi uses the forefinger of the left hand instead of the stick which Reichmann recommends (see above). He taps with the right forefinger on the second joint of the left forefinger placed perpendicularly on the skin while listening through the stethoscope. By this means it is easy to differentiate a pleural effusion from pneumonia. The best point for the auscultation is on the scapular line inside the dullness, following the line downward. If there is a pleural effusion the sound changes at the costal arch while in case of pneumonia without exudate the sound changes two finger-breadths above this. In case the effusion is bilateral the change occurs at the same height on each side. This auscultatory percussion is more valuable in differentiating a pleural effusion than percussion of Traube's space, as it can be extended over the entire chest.

**74. The Blood Count in Mumps.**—Pick relates that more than 623 cases of mumps have occurred in Prague during the last seventy-one weeks and the epidemic has included an unusual number of adults. The blood count in ten cases examined showed that the number of leucocytes was constantly normal. The lack of hyperleucocytosis may aid in differentiating mumps from orchitis of other origin, gonorrheal for instance, which was accompanied by a leucocytosis of 8000 to 16,000 in four cases examined. Its absence in mumps classes the disease as a purely serous exudation in the group with serous pleuritis or articular rheumatism.

**77. Puerperal Rheumatism.**—Singer has observed six cases of articular rheumatism or its equivalent endocarditis, developing during a febrile puerperium. He described some time ago a case of gonococcus pyemia following on the enucleation of a myoma. The primary gonorrheal affection had occurred years before and the cocci had probably been lying latent in the tissues until new and favorable conditions for its growth were produced by the operation. The same mechanism probably explains the rheumatism which accompanies or directly follows a childbirth. Lebert has described a fatal case of endocarditis commencing in the fourth month of pregnancy. Lenhartz has witnessed two fatal cases of puerperal nephritis or acute articular rheumatism in both of which numbers of streptococci were found. Puerperal rheumatism differs in no respect from the ordinary acute articular rheumatism and it can be classified as of gonorrheal origin or as due to the staphylococcus or streptococcus. In case of valvular affections of unknown etiology, the possibility of previous puerperal infection should be borne in mind.

**79. Treatment of Tuberculous Hemoptysis.**—Weismayr is superintendent of the Alland Sanatorium and proclaims that he has not had a single case of severe hemorrhage from the lungs since he adopted the method of treating hemoptysis which he outlines. He aims to arrest it in its incipency and not allow severe hemorrhage to occur. Traces of blood in the sputa after coughing or one or two bloody expectorations in the early morning do not indicate special medical intervention beyond imposing quiet. But if traces of blood are noted frequently in the sputa or the patient spits pure blood and it is traced to the lung, he should go to bed at once, with absolute physical and mental repose. The diet should be mostly liquid, and some narcotic should be administered to suppress coughing. Even the slightest hemorrhage may be from some large vessel and any indiscretion may bring an outpour. If the hemorrhage is considerable from the start, expectoration of the accumulated blood must be promoted and narcotics of any kind are strictly contra-

indicated. The patient should lie propped up in bed with an ice bag over the heart, but the first and most important measure is to wrap each limb with a bandage commencing at the periphery. It should be applied only tight enough to check the return flow of venous blood and not enough to prevent the inflow of fresh blood. This has a remarkable effect in reducing the blood pressure and will frequently arrest the hemorrhage at once. The patient "bleeds into his limbs" as it were. The bandage that is most annoying is removed first, thus gradually removing them all in turn, but with long intervals between them. Expectoration should be promoted by every means, deep breathing to excite coughing, even an emetic, but he has never had to resort to these, as the bandages to the extremities and the avoidance of narcotics have always answered the purpose. So long as fresh blood can be detected in the sputa the patient should take nothing but cold milk, sipping a little very slowly and often, possibly every fifteen minutes. Solid and warm food, alcohol, coffee, tea and the like must be strictly avoided and constipation prevented by irrigations. The patient should not leave the bed for at least three days after the sputa have been entirely free from blood and he should afterward refrain from every thing calculated to increase the blood pressure.

**80. Diet and Treatment in Chronic Kidney Affections.**—During the last two years Wiczowski has been making careful investigation of the effects of a milk diet, white meat and dark meat in turn for one or two weeks at a time in 85 cases of chronic kidney affections. He was unable to discover any evidence showing that the diet in a single instance had an influence on the amount of albumin eliminated. On the other hand, the patients who were allowed to eat at will enjoyed their food with so much more relish that their general condition far surpassed those on the milk or other special diet. He found, however, that one or two table-spoonfuls of olive or cod-liver oil had an unmistakable effect in diminishing the albuminuria and edema, while the general health also improved under it. It seems as if the fat promoted the digestion of albumin. He found venesection useful in case of uremic symptoms. In three cases the effects of the venesection surpassed all expectations as it was followed by complete recovery after three weeks in one case and after two and four months in the others.

**81. Acute Hemorrhagic Pancreatitis.**—Kraft produces evidence to prove that fat necrosis is not necessarily a sign of a preceding pancreatitis but may have some other origin. On the other hand, the absence of fat necrosis is not a sign that there has been no pancreatitis. He adds that there is not a single pathognomonic sign on record in pathologic anatomy to reveal that the subject has passed through an acute hemorrhagic pancreatitis. It may develop without causing a single symptom or merely vague ones with no characteristic features, although resistance and tenderness in the epigastrium are usually noted. Reviewing twelve cases he has had occasion to observe he notes that one simulated appendicitis, one ileus and several gallstone colic or perforation of the stomach. This variety in the symptoms he ascribes to the fact that the pancreatitis causes first merely loss of appetite and vague digestive disturbances with general lassitude, until the hemorrhage occurs and stretches the capsule and with it the parietal peritoneum which Lemander has shown is the only portion of the peritoneum which is sensitive. The intensity of the pain is proportional to the amount of the hemorrhage and the attack recurs with a new hemorrhage. The intervals are free from pain so long as the hemorrhages are small. Hemorrhage in the pancreas itself causes pains in the region of the umbilicus and they do not radiate. If a hemorrhage occurs which bursts the capsule and the blood settles at the root of the mesentery or, as is more liable, flows down between the two sheets of the mesocolon corresponding to the transverse and ascending colon, the pains shift more to these points, and there is constant tenderness on pressure and more or less pain. The inflammation may remain restricted to the pancreas or may spread in various ways. The most frequent is the invasion of the omentum. The foramen of Winslow may become closed in the course of the inflammatory process by deposits of fibrin, thus limiting its

further extension as occurred in one of the cases described. Or the inflammation may spread along the under surface of the liver and cause tenderness in this region, or along the colon into the greater cavity of the peritoneum. The inflammation in exceptional cases follows the same route as the hemorrhage and causes extraperitoneal inflammation between the two sheets of the ascending mesocolon or in the mesentery. The pancreatitis may terminate in complete recovery and we have no means of knowing how often this happens. The severe forms are generally fatal. Only two of the twelve cases described terminated in recovery. In the others there were evidences of coincident tuberculosis, syphilis, cardiac affections or cholemia. Laparotomy was done in one case on account of gallstones and as an exploratory measure in another, but death soon followed in each instance. One of the patients who recovered was a woman of 56 who had exhibited symptoms of a gastrointestinal catarrh for a few months when suddenly pains developed accompanied by menacing collapse. The symptoms suggested perforation of the stomach, but the excruciating pain might also be explained by hemorrhage in the pancreas. The latter diagnosis was confirmed by the discovery of two fluctuating tumors to the rear of the stomach. The tumors gradually decreased in size as pancreatin was administered. The patient slowly recovered her usual health. The second case commenced suddenly with gastrointestinal symptoms as in the preceding case, nausea, oppression in the cardia, eructations and some diarrhea. These symptoms amended, but suddenly severe, non-radiating pain developed in the umbilical region. It lasted fifteen minutes. The patient was a machinist, 38 years old. A similar attack recurred the next morning, the pains also localized at the umbilicus but extending rather more to the back. The acute pains subsided in the course of a few hours, but left a dull pain rather below and to the rear of the stomach. During the attack of pain he vomited once and eructations were frequent, with passage of flatus and stools. The abdomen was hard, especially above the umbilicus, where it was somewhat distended. There was considerable tenderness over the abdomen, but it did not extend into the flanks and no tumor could be palpated. The diet was regulated and opium given, with pancreatin, and two months after the beginning of his illness he was able to resume work. The slow recovery confirmed the diagnosis of acute hemorrhagic pancreatitis. The age was also a point in its favor. The urine was apparently normal in both these cases. Kraft's patients were between 24 and 40 except one, who was 70, four who were between 50 and 60 and one, 44 years old. Each case is described in detail with the postmortem findings at ten autopsies. Gallstones were found in only two, but in another there was compression from a cyst in the pancreas and in another there was thrombosis in the portal vein. Pancreatin seemed to exert a very favorable influence on the course of the affection in the two cases in which it was administered.

**84. Cure of Exophthalmic Goiter.**—Massini's treatment was a combination of complete psychic repose, regulation of the diet, pills of carbonate of iron and Faradization, applying the positive pole to the back of the neck and the negative to the eyes, throat or heart. When the patient left the hospital the pulse had been reduced from 155 to 75 or 80, and there was no trace of the goiter nor tremor.

**86. Spinal Cocainization in Sciatica.**—Cavazzani of Venice has been systematically applying this method of treating sciatica and reports brilliant results from it. All his patients were cured and none has had a recurrence since, some for more than a year. He proceeds according to Tuffier's directions except that he allows 2 or 3 gm. of the cerebrospinal fluid to flow. He collects it in a porcelain vessel already containing 2 eg. of cocain hydrochlorate in the form of a powder. It rapidly dissolves in the fluid and the whole is then reinjected slowly through the same needle. There were no by-effects noticeable in any of the twenty patients thus treated except transient nausea in one case, not sufficient to induce vomiting.

**89. Splenectomy for Movable Malarial Spleen.**—The spleen weighed 1980 gm. and was 14 by 25 cm. in size. The patient was restored to comparative health by its removal.

91. **Toxic Origin of Seborrhea.**—Tito suggests that seborrhea may be due to the elimination of toxins elaborated in the organism. It usually follows some protracted illness, and is in turn followed by a greater or less degree of neurasthenia.

92. **Difficulty in Diagnosing Certain Cases of Typhoid Fever and Appendicitis.**—Dahlgren's article is based mainly on the work of Thayer, Deaver, Cushing and other Americans, with his own experiences. He agrees with the recent communications in regard to the importance of the leucocyte count for the differentiation.

93. **Significance of Hyperplastic and Tuberculous Processes in the Pharyngeal Tonsils.**—Floderus believes that a large proportion of scrofulous children are tuberculous. He found enlarged submaxillary glands in 92.06 per cent. of several hundred children investigated, and enlarged jugular glands in 91.6 per cent. The pharyngeal tonsils were enlarged in 48.89 per cent. of the cases of much hypertrophy of the jugular glands, and the tonsils proper in 32.59 per cent. He emphasizes the importance of these findings as a menace to the future health of the child, believing that the morbid pharyngeal tonsils in particular are the source of descending tuberculosis later. The adenoid child is thus especially predisposed to secondary tuberculosis.

## Queries and Minor Notes.

### MEDICAL PRACTICE IN COLORADO AGAIN.

INTERIOR, VA., June 2, 1902.

*To the Editor:*—Please give me the law for medical registration in Colorado, and the name and address of the secretary of the Board.

C. S. K.

ANS.—A diploma from a legally chartered medical college, recognized by the Board of Examiners, showing attendance on four courses in four separate years, or a satisfactory examination. Secretary Board of Examiners, Dr. S. D. Van Meter, Denver.

### MUST INTERNES BE LICENSED PHYSICIANS?

CHICAGO, May 25, 1902.

*To the Editor:*—Must a hospital interne in New Jersey have a license while serving his internship? If not, will he also be allowed to go out on the hospital ambulance?

J. H. G.

ANS.—The law in regard to state medical examination in New Jersey does not apply to any one while actually serving as a member of the resident medical staff of any legally incorporated charitable or municipal hospital or asylum.

## The Public Service.

### Army Changes.

Movements of Army Medical Officers under orders from the Adjutant-General's Office, Washington, D. C., May 22 to 28, 1902, inclusive:

William B. Banister, major and surgeon, U. S. A., member of a retiring board to meet at the War Department, Washington, D. C.; also member of a board to meet at Washington, D. C., to examine officers of the Army for promotion.

William H. Block, captain and asst.-surgeon, Vols., on the expiry of his present leave of absence, will report for temporary duty at Fort Mellenry, Md.

August von Clossman, contract surgeon, member of a board at Jefferson Barracks, Mo., to examine officers of the Army for promotion.

Christopher C. Collins, lieutenant and asst.-surgeon, U. S. A., from duty at the General Hospital, Presidio of San Francisco, to Manila, P. I., for assignment in the Division of the Philippines.

Elmer A. Dean, lieutenant and asst.-surgeon, U. S. A., now at San Francisco, to report for duty at the General Hospital, Presidio of San Francisco.

Joseph H. Ford, lieutenant and asst.-surgeon, U. S. A., member of a board to meet at Washington, D. C., to examine officers of the Army for promotion.

Edward F. Geddings, lieutenant and asst.-surgeon, U. S. A., from duty at Morro Castle, Santiago, Cuba, to duty at the Indianapolis Arsenal, Department of the Lakes.

Edward T. Gibson, captain and asst.-surgeon, Vols., relieved from further duty on the transport *Crook*, and assigned to duty in the Division of the Philippines.

Luther S. Harvey, captain and asst.-surgeon, Vols., leave of absence on account of sickness is further extended fifteen days.

Deane C. Howard, captain and asst.-surgeon, U. S. A., from duty in the Artillery defenses of Havana, Cuba, to duty at Morro Castle, Santiago, Cuba, relieving Lieutenant Edward F. Geddings, asst.-surgeon, U. S. A.

George B. Jones, contract surgeon, former orders revoked; as soon as his services can be spared in the Department of California he will report for transportation to Manila, P. I., for assignment in the Division of the Philippines.

William P. Kendall, major and surgeon, U. S. A., detailed to represent the Medical Department of the Army at the Eleventh Annual Meeting of the Association of Military Surgeons of the United States, to be held at Washington, D. C., June 5 to 7, 1902, in addition to those already designated for this duty.

Theodore C. Lyster, lieutenant and asst.-surgeon, U. S. A., former orders relieving him from duty at the General Hospital, Presidio of San Francisco, to proceed to Manila, P. I., for assignment, revoked.

Clarence J. Manly, lieutenant and asst.-surgeon, U. S. A., leave of absence extended one month.

Paul Mazzuri, captain and asst.-surgeon, Vols., leave of absence for one month, with permission to apply for an extension of one month, granted.

James C. Merrill, major and surgeon, U. S. A., member of a retiring board to meet at the War Department, Washington, D. C.

William H. Moncrief, contract surgeon, member of an examining board at Jefferson Barracks, Mo., vice Contract Surgeon August von Clossman, relieved.

William H. Pomeroy, contract surgeon, leave of absence for two months, with permission to go beyond sea granted, to take effect about June 18, 1902.

John M. Shepherd, contract surgeon, former orders directing him to proceed to Fort Schuyler, N. Y., amended so as to direct him to proceed to Fort Hamilton, N. Y., for duty.

John H. Stone, captain and asst.-surgeon, U. S. A., member of an Army retiring board at Washington, D. C., vice Major James C. Merrill, surgeon, U. S. A., relieved.

Francis A. Winter, captain and asst.-surgeon, U. S. A., member of a board at Jefferson Barracks, Mo., to examine officers of the Army for promotion.

### Navy Changes.

Changes in the Medical Corps of the Navy, for the week ending May 31, 1902:

Surgeon J. H. Field, appointed surgeon from May 19.

Asst.-Surgeon W. H. Ullsh, granted sick leave for 3 months.

Pharmacist R. Waggener, ordered to Key West Naval Station.

Pharmacist S. W. Douglass, detached from Key West Naval Station and ordered to Naval Proving Ground, Indian Head, Md.

P. A. Surgeon F. L. Benton, detached from the *Columbia*, May 31, and ordered to duty with a recruiting party, leaving New York on that day.

### Health Reports.

The following cases of smallpox, yellow fever, cholera and plague have been reported to the Surgeon-General, U. S. Marine-Hospital Service, during the week ended May 31, 1902:

#### SMALLPOX—UNITED STATES.

California: Los Angeles, May 10-17, 5 cases; San Francisco, May 11-18, 1 case.

Colorado: Denver, May 10-17, 1 case.

Illinois: Chicago, May 17-24, 14 cases.

Kentucky: Covington, May 10-24, 22 cases; Lexington, May 10-17, 2 cases.

Louisiana: Shreveport, May 17-24, 1 case.

Massachusetts: May 17-24, Boston, 28 cases, 6 deaths; Fall River, 1 case, 1 death; Lowell, 3 cases; Malden, 2 cases; Melrose, 2 cases, 1 death; Somerville, 1 case.

Michigan: Detroit, May 17-24, 6 cases.

Minnesota: Minneapolis, April 18-May 17, 23 cases; Winona, May 17-24, 4 cases.

Missouri: St. Joseph, April 1-30, 50 cases, 2 deaths.

New Hampshire: Nashua, May 17-24, 2 cases.

New Jersey: Camden, May 17-24, 2 cases; Newark, May 17-24, 53 cases, 8 deaths.

New York: New York, May 17-24, 36 cases, 11 deaths; Yonkers, May 16-23, 1 death.

Ohio: Cincinnati, May 16-23, 14 cases; Cleveland, May 9-16, 8 cases, 4 deaths; Dayton, May 17-24, 2 cases.

Pennsylvania: Johnstown, May 17-24, 4 cases; Philadelphia, May 17-24, 30 cases, 3 deaths.

Tennessee: Memphis, May 17-24, 8 cases.

Utah: Salt Lake City, May 10-17, 1 case.

Washington: Tacoma, May 11-18, 1 case.

#### SMALLPOX—FOREIGN.

Belgium: Liege, April 26-May 3, 1 death.

Canada: Winnipeg, May 10-17, 3 cases, 1 death.

France: Paris, April 26-May 3, 4 deaths; Rheims, April 25-May 4, 2 cases, 1 death.

Great Britain: Glasgow, May 9-16, 1 case; Jarrow-on-Tyne, May 3-10, 2 cases; London, May 3-10, 248 cases, 44 deaths; New Castle-on-Tyne, May 3-10, 1 case; South Shields, May 3-10, 6 cases.

India: Calcutta, April 18-26, 6 deaths; Madras, April 19-25, 1 death.

Italy: Palermo, May 3-10, 9 cases, 2 deaths.

Japan: Formosa, Tamsui, Jan. 1-31, 15 cases; Nagasaki, April 21-30, 1 case.

Mexico: Vera Cruz, May 10-17, 6 cases, 5 deaths.

Russia: Moscow, April 26-May 3, 8 cases, 1 death; St. Petersburg, April 26-May 3, 7 cases, 1 death.

Straits Settlements: Singapore, March 29-April 12, 1 death.

Turkey: Smyrna, April 27-May 4, 2 deaths.

#### YELLOW FEVER.

Mexico: Vera Cruz, May 10-17, 14 cases, 8 deaths.

#### CHOLERA.

India: Calcutta, April 19-26, 146 deaths.

Straits Settlements: Singapore, March 29-April 12, 48 deaths.

#### PLAGUE—INSULAR.

Hawaii: Honolulu, May 8-13, 5 deaths.

#### PLAGUE—FOREIGN.

China: May 19, Canton, epidemic; Yityang, epidemic; Taileung, epidemic.

India: Calcutta, April 19-26, 577 deaths.

Japan: Formosa, Tamsui, Jan. 1-31, 159 cases, 141 deaths.

### ANALYSIS OF NINETY-SIX OPERATIONS FOR THE RELIEF OF TUBERCULOSIS OF THE TESTICLE.\*

ORVILLE HORWITZ, B.S., M.D.,

Clinical Professor of Genito-Urinary Diseases, Jefferson Medical College; Surgeon, Jefferson Medical College Hospital, Philadelphia Hospital, State Hospital for the Insane.

PHILADELPHIA.

It is only within a recent period that the profession has begun to realize the fact that tuberculosis of the genito-urinary organs is a disease of very common occurrence; the infection by the tubercle bacillus taking rank next in point of frequency to the gonococcus. This has naturally resulted in attracting unusual attention, while the subject is being carefully studied by many of the most eminent men in the medical world; but, it is curious to note, after consulting the literature of the subject, what great diversities of opinion exist touching the most essential features of the disease as well as the best methods of treatment. During the past twelve years, as unusual facilities for observing and studying tuberculosis of the genito-urinary organs have fallen to the share of the writer, it has occurred to him that a brief account of his experience with one of the most common forms of the affection, tuberculosis of the testicle, might not be uninteresting to the profession and at the same time serve to shed some light on the questions that are as yet undecided and still under discussion. The cases operated upon are those that came under his cognizance at the Philadelphia Hospital and the Jefferson Medical College Hospital and may be classified as follows:

#### JEFFERSON HOSPITAL.

|   |    |
|---|----|
| Localized tubercular abscess of the testicle.....                     | 8  |
| Tubercular abscess of the epididymis.....                             | 2  |
| Sinus of scrotum following tubercular abscess of testicle...          | 3  |
| Epididymectomy (single), partial resection of the vas deferens .....  | 13 |
| Epididymectomy (single), complete resection of the vas deferens ..... | 4  |
| Epididymectomy (double), partial resection of the vas deferens .....  | 4  |
| Castration for tubercular testicle with radical cure of hernia .....  | 1  |
| Castration with complete resection of vas deferens.....               | 8  |
| Castration for tubercular testicle (single).....                      | 36 |
| Castration, tubercular testicle (double).....                         | 3  |
| Castration, resection of vas deferens and seminal vesicles...         | 3  |

\* Read before the American Association of Genito-Urinary Surgeons, at Atlantic City, April 29-30, 1902.

#### PHILADELPHIA HOSPITAL.

|   |    |
|---|----|
| Castration, tubercular testicle (single).....           | 4  |
| Epididymectomy, partial resection of vas deferens.....  | 3  |
| Epididymectomy, complete resection of vas deferens..... | 1  |
| Tubercular abscess, drainage and use of eurette.....    | 3  |
| Total .....   | 96 |

The foregoing exhibits a list of 55 castrations and 25 epididymectomies. The excess of the first-named operation is due to the fact that when many of the orchidectomies were performed, epididymectomy was not an established surgical procedure, but was generally unknown, although it had been performed as early as 1850 by Jarjavay. It is only within the last twelve years that contributions have been made to the literature of this subject; for these the profession is indebted to the pens of Bardenheuer, Tuffier, Villeneuve, Duplay, Humbert, Legars, Guyon, Mynter, Senn, Murphy, and Young, who have taught that the conservative course is the proper one to pursue when the epididymis alone is infected by the tubercular bacillus. Many cases where castration was performed would at the present time be deemed suitable for resection of the epididymis.

It is interesting to note that as far as can be ascertained the disease began in the epididymis in 48 cases, in the testicle in 27 cases, and in the remaining 21 cases the primary location of the disease was in:

|  |         |
|--|---------|
| Kidneys in .....                             | 3 Cases |
| Prostate gland, vesicles, or bladder in..... | 14 "    |
| Lungs in .....                               | 3 "     |
| Hip joint in .....                           | 1 "     |

#### HEREDITY AS AN ETIOLOGIC FACTOR.

Heredity seems to play but a slight rôle as a factor in cases of primary tuberculosis of the testicle in the adult, as in but a few instances could a predisposing family history be obtained. That the disease is in rare instances congenital is shown by the fact that a case is reported in the *British Medical Journal*, 1884, by Dreschfeld, of a child born with a tubercular testicle. Jacobson states that "Giralds is said to have met with a similar condition in an infant at term." Koenig saw a child in whom the disease developed a few days after birth. Tuberculosis of the testicle in children has been reported by Koenig, Lannelongue, and Julien; the latter records six cases, occurring in children under one year of age. This clinical evidence proves conclusively that heredity may be a factor in causing the disease. From the writer's experience he is inclined to believe that tuberculosis of the seminal glands in young children is so rare as to be ranked as a medical curiosity. Dr. Edwin Graham, Professor of Diseases of Children in the Jefferson Medical College, whose experience with dis-

cases of children is very large, at least three thousand patients being annually treated at his clinic, states in a personal communication that he has "never met with a case of the kind, either congenital or otherwise." This accords with the experience of the writer. Of the 96 patients who submitted to operations, the youngest was 15 years of age and the oldest was 61, the average being about 30. In rare instances the disease has been known to occur very late in life. Gibson reports a case under his care where the individual was 81 years old. In fact, tubercular diseases of the testicle in the very young, or in those advanced in years, is a very infrequent occurrence, the ailment being most commonly met with between the ages of 20 and 40, the time during which sexual vigor is most active. This view is in accord with that held by most observers.

#### TRAUMATISM AS A CAUSE.

Authorities differ as to the frequency of slight traumatism as a factor in the production of testicular tuberculosis. Jacobson, Lydston, Murphy and others incline to the belief that injuries so slight as to be soon forgotten, in many instances, after the lapse of several weeks, are followed by tuberculosis of the organ. This view is founded on the well-known fact that the bacillus gains ingress into the body through the skin, lungs, gastro-intestinal and genito-urinary tracts, entering the circulation most commonly, according to Bugge, by means of the mediastinal glands. Tubercle bacilli have been detected in the normal epididymis, testicle and circulation and a slight injury, which creates a "*locus minoris resistentiae*," may so alter the tissue that the germ, which hitherto was harmlessly circulating in the blood or innocuously resting in an organ, may become obstructed in the inflamed area, finding a suitable soil for its multiplication, and thus giving rise to tubercular infection. The truth of this proposition has been demonstrated experimentally by injecting into the blood of the peritoneum of animals, sputum containing tubercle bacilli; and then bruising the testicle, when it has been found that tuberculosis of that organ almost invariably supervenes. It would appear, therefore, that anything that causes an inflammatory condition of the part will predispose to a tubercular disease of the testicle: hence, a gonorrheal epididymitis is frequently the forerunner of tuberculosis. Experience proves that when tuberculosis follows a gonococci infection of the epididymis that the disease is always located primarily in this structure; a knowledge of this fact has an important bearing on the proper method of treatment.

#### CAUSATION BY GONORRHEA.

A brief account of the following case will serve to exhibit the effect produced by the action of the gonococci as a predisposing cause of tubercular epididymis:

CASE 1.—J. H., 23 years of age, became an outdoor patient in the genito-urinary department of the Jefferson Hospital during the last week of July, 1900, suffering from an attack of acute anterior urethritis. About the middle of August he developed a severe attack of epididymo-orchitis of the right testicle and was admitted to the wards of the institution. In the course of two weeks the acute inflammatory symptoms subsided, leaving the globus minor hard, nodular, and tender; one week later it was found that the head of the epididymis was also similarly involved. There was still a slight mucoid discharge from the urethra. A bacteriologic examination showed that the gonococci had disappeared; tubercle bacilli could not be found. The condition was clearly a tubercular infection and an operation was advised. This diagnosis was not in accord with that of one of our colleagues who met the writer in consultation; he was inclined to look upon the con-

dition as a chronic inflammatory condition following the gonorrheal infection. The epididymis together with a portion of the vas deferens was resected. The organ was found to contain cheesy masses which were tubercular, the globus minor containing a small circumscribed abscess about the size of a large pea. In this case no history of an hereditary tendency to disease could be obtained. The patient rapidly improved in health and strength and, when last seen a few weeks since, was in perfect health.

#### TUBERCULAR VARIETY OF INFECTION.

That a severe injury of the testicle is but rarely followed by a tubercular infection of the part is a fact to which the profession has assented since Volkmann first made the statement in 1855, who claimed that a severe injury was followed by such active tissue change during the process of repair that the growth and multiplication of the bacilli were prevented. That tuberculosis may occasionally follow a grave injury to the organ is elucidated by the following case:

CASE 2.—S. M., aged 40, occupation mounted policeman. Admitted to the Jefferson Hospital in October last. Stated that one year and a half previous to his admission, while on horseback, the animal unexpectedly bucked and threw him forward on the pommel of the saddle, striking the left testicle a severe blow which rendered him sick and faint. Intense pain in the part was experienced, the scrotum becoming enormously swollen and discolored. He was confined to his bed for six weeks, the inflammatory symptoms gradually subsiding, leaving the organ much enlarged and somewhat tender. Its normal size was not regained. He suffered considerable pain from time to time. Ten days before his admission to the institution, he again struck the organ a severe blow against the corner of an ash box. The scrotum immediately became distended and, according to the individual's statement, as black as his shoe, giving rise to greatly increased pain.

The scrotum was distended; there were pseudo-fluctuation and ecchymosis. The testicle was painful and the upper portion seemed to have undergone a cystic change, fluctuating on palpation. On opening the tunica vaginalis it was found to contain a small quantity of recent blood together with a disorganized blood clot, evidently the remains of an old hematoma. The upper portion of the testicle was the seat of a large abscess, and numerous large tubercular deposits were found throughout the organ. Report from the pathologic laboratory proved the organ to be tubercular.

#### ANATOMIC REASON FOR TUBERCULOSIS.

It is very difficult to procure a preceding history of cases that present themselves; where traumatism has occurred it is usually so slight that the patient can seldom recall the incident. It appears probable that in the majority of cases where there is a primary tubercular infection of the epididymis, without any predisposing cause being discovered, that the bacillus is carried to the organ by means of the blood. It is well known that this germ may be present in the circulation without producing harm; as has already been pointed out, it has even been detected in the normal testicle, the resisting power of the structure being lowered by an inherited tendency, traumatism, disease of the testicle, or gonorrheal orchitis. Saltzmann advances a theory which appears to be very reasonable; that is, that the frequency of a primary tubercular epididymis is due to an anatomic cause. It is well known that the spermatic artery bifurcates just before it enters the epididymis; this, with the fact that the vessels which ramify throughout the structure are smaller and more tortuous than those of the testicles, leads him to infer that the bacilli floating in the blood are more apt to become lodged in the epididymis than in the testicle. This idea seems to be verified by the clinical observation that in the primary infection the begin-

ning of the disease in the majority of instances will be found to be located in the globus major. Where the tubercular trouble is secondary to an infected focus in some other portion of the genito-urinary tract, the first part of the epididymis to become diseased is, as a rule, the globus minor, which is, as is well known, the usual seat of induration left by a gonorrheal epididymitis; so that a tubercular induration beginning in the lower portion of the epididymis often makes a differential diagnosis of the two conditions extremely difficult unless there is evidence to show that the condition of the testicle is due to a descending tubercular infection.

#### INFECTION VIA LYMPH CHANNELS.

Whether primary infection ever takes place through the lymph channels is a question which is still *sub judice*, and will probably remain so, since a convincing demonstration of an infection taking place in this manner does not seem possible. The consensus of opinion is that infection by this means must be extremely rare as the lymph current is directed away from the organ rather than towards it. That a secondary infection of different structures very commonly takes place by means of the lymph channels appears to be very probable when the investigations of the lymphatic vessels of the testicle by Most are considered; he used the method of injection suggested by Gerota<sup>1</sup> and found that by injecting the testicle that he was enabled to fill the thoracic duct: that the testicle was very rich in lymphatic vessels which united in from four to six trunks, passing up alongside the spermatic vessels of the cord, ultimately emptying into the receptaculum chyli.

#### IS TUBERCULOSIS TRANSFERRED IN VENERY?

M. Verneuil believes that cohabitation with women suffering from tuberculosis of some portion of the genital tract is frequently responsible for primary infection in the male. The writer never met with a case which could be traced to this act; while admitting that it may be possible, its occurrence must be very rare. If men contract tuberculosis from intercourse with women who suffer from a tubercular infection of some portion of the genitalia the converse should be equally true; yet such does not seem to be the case. It frequently happens that men with tuberculosis of either one or both testicles have connubial intercourse with their wives who remain free from infection. One case is recalled where the epididymis, vesicle and vas deferens were involved on both sides, the diseased condition being of long standing. The wife, at the time that her husband was operated on being seven months advanced in her pregnancy, was delivered at term of a healthy child. An examination of both the man and woman, one year after the operation, was made and it was found that both enjoyed good health: the woman was free from all symptoms of tubercular disease.

#### TUBERCULOSIS BECOMING A GENERAL INFECTION.

That primary tuberculosis of the epididymis may result in a general infection is shown by the history of the following case:

CASE 3.—Colored man, admitted to the Jefferson Hospital in December last. Family history regarding malignant and tubercular diseases, negative. No venereal history. Two years ago, first noticed a painless lump in the epididymis of the left side. One year later he began to suffer from an irritable bladder, passing water frequently both by day and night. The right testicle soon became enlarged and tender. Two months before entering the hospital he developed a very troublesome

cough, attended occasionally by a slight spitting of blood. He lost 40 pounds during the last year, is very weak and suffers from constant night sweats. Examination revealed tuberculosis of the left and right testicles, vas deferens, seminal vesicles and probable involvement of the prostate and bladder. There was beginning tuberculosis at both apices. Tubercular bacilli were found in the urine. In this case there is scarcely any doubt that the general infection was an ascending one.

#### SOURCES OF TUBERCULOSIS.

In the twenty-one cases in whom the seat of primary invasion of the bacilli was either the lungs, kidney, bladder, prostate gland, or seminal vesicles, a reliable history was obtained either from the physicians in attendance or from the individuals themselves. The history here given of a case where the beginning of the tubercular infection was in the hip joint is unusual and unique.

CASE 4.—W. S., aged 23, medical student. Tubercular history on his mother's side. Enjoyed good health until four years of age, when he sustained a slight fall which was followed by hip-joint disease; an abscess formed which terminated by sinuses leading down to the joint. The patient was an invalid for several years. The fistulous tract gradually healed, leaving the head of the bone displaced upwards and backwards, the limb being shortened and atrophied. There is no venereal history. Two years before his first visit he noticed that the epididymis on the left side was enlarged, nodular, but painless. A few months later the other side became similarly affected. Two months before he was first seen the parts became tender and the seat of neuralgic pains. A double epididymectomy was performed and the vas deferens removed as high as the external abdominal ring. Both structures were found to be the seat of extensive tubercular disease. Eighteen months have elapsed since the operation: the patient has gained in weight and is in strong and good physical condition.

#### THE RELATION TO POTT'S DISEASE.

Murphy says that "Pott's disease of the spine has frequently been observed to follow tuberculosis of the testicle." Observations lead to the belief that diseases of the spine either preceding or following testicular tuberculosis must be very uncommon. In none of the cases under the observation of the writer did this condition pertain. Dr. H. A. Wilson, Clinical Professor of Orthopedic Surgery at the Jefferson Medical College Hospital, in a personal communication in reference to this subject says: "Careful search in the records of my private practice and the very large orthopedic service at the Jefferson Medical College Hospital fails to reveal a single instance wherein a tubercular spinal disease was followed by or existed with tubercular disease of the testicle. I have no recollection of ever having seen such a condition in my service at the Philadelphia Hospital, Polyclinic or Women's Medical College Hospital. While I would not say that such conditions were impossible, I must consider them as extremely rare or else I would have seen illustrations."

#### URETHRITIS AS A FACTOR.

The following remarkable case shows the existence of a secondary infection of the testicle following a primary invasion of the urethra:

CASE 5.—The patient, aged 25, was first seen during the month of January, 1901. He had had repeated attacks of gonorrhea since the age of 16. He was suffering from a tight stricture in the lower third of the penile urethra, which was resilient and had to be kept constantly dilated. Two weeks before his first visit, after a debauch, he had an attack of retention of urine, which he tried to relieve by the use of the catheter; the instrument was broken in the attempt, resulting in free hemorrhage. On examination, a large periurethral abscess was found, which was opened and drained, and an operation on the stricture was advised. This was declined. The patient was

1. Arch. f. Anat. u. Physiol. Anat. Abth., 3 u. 4 S., 113, 1899.

lost sight of for a month when he consulted the writer's colleague, Dr. H. R. Loux, who courteously furnished the future history of the case. He found that the under surface of the penis was nearly destroyed by what appeared to be a phagadenic ulcer. The stricture was operated on and an attempt made to arrest the ulcerative process without success, and a few weeks later it became necessary to amputate the organ at the peno-scrotal junction. A short time afterwards the glands in the left groin became diseased and were removed, after which the patient convalesced and remained in good health until last February, when the removal of the left testicle became necessary by reason of miliary tuberculosis. The pathologic report by Professor Coplin showed the condition of the penis to be tubercular.

#### CASES OF INEXPLICABLE URETHRITIS.

In six of the cases a history of unexplainable urethral discharge preceded by several weeks the development of the disease of the testicle. In two instances the discharge was purulent in character; in one, tinged with blood, the others being mucoid. One of the cases is so instructive that a brief account is deemed pertinent.

CASE 6.—Minister, aged 30, unmarried, affected with a mucopurulent discharge, occurring principally in the morning; no pain or irritability of the bladder. Had existed for two weeks previous to his first visit. He denied ever having been exposed to any danger of contagion. The urine was slightly cloudy, containing a small amount of pus, mucin in solution, and epithelial cells. Neither gonococci nor tubercle bacilli could be detected. An endoscopic examination of the urethra showed well-marked congested patches in the vicinity of the bulb and the prostatic portion of the canal. The case was recorded as one of probable non-specific urethritis; the individual's statement regarding his not having been exposed to the danger of infection was taken *cum grano salis*. The condition was unimproved by treatment. Nine weeks after he was first seen a hard nodule developed in the globus minor of the left epididymis, which was painless and persistent. The case was diagnosed as tubercular and the epididymis resected. A microscopic examination of the removed structure verified the correctness of the diagnosis. When the individual became convalescent, the discharge completely disappeared.

#### TUBERCULAR CAUSE OF URETHRITIS.

This case teaches that when an unexplainable urethritis arises which is chronic from the onset we should be on our guard against a development of tuberculosis in some portion of the genito-urinary tract. In every case examination should be made of the secretion for the presence of tubercle bacilli, both before and after stripping the seminal vesicles. The urethral discharge in these cases may be due to various causes. Probably the most common is a catarrhal condition of the prostatic urethra. Jacobson states that when the discharge is either a clear viscid fluid, or opaque and whitish, which drops from the meatus, unattended by inflammatory symptoms, the cause is usually due to a hypersecretion of the prostatic fluid, owing to the slow formation of tubercles in the gland. Tubercular blennorrhea has been known to be due to the formation of small tubercular abscesses in the prostatic gland. Delbeau asserts that the condition is at times produced by an ulceration, tubercular in character, in the posterior urethra: when this condition exists there is burning pain on micturition, frequent urination, terminating in hematuria. Finally, a tubercular focus located in some portion of the mucous membrane of the urethra may cause an exacerbation of chronic gonorrheal lesion in some portion of the canal.

#### ONSET MAY RESEMBLE ORCHITIS.

The onset in all the cases of primary infection of the epididymis was slow and insidious, except in six in-

stances, in four of which the symptoms simulated exactly those produced by an acute epididymo-orchitis. In the two remaining instances the onset was violent, probably due to a mixed infection, and an abscess formed within a few days after the onset of the disease. The beginning frequently resembles that of an ordinary orchitis and renders the diagnosis obscure, as the following case exemplifies:

CASE 7.—M. J., affected with syphilis 15 years before; was under treatment for three years, no symptoms since. Slight attack of gonorrhea when 20 years of age. Two weeks before seen, he slipped on the ice and gave the testicle a wrench, which immediately became the seat of acute pain. The pain did not disappear as the patient expected, but increased in severity as the day went on. By night the organ was swollen and very tender.

A diagnosis of orchitis was made and the case was treated as such. In view of the fact that there was an old syphilitic history in the case, specific treatment was pushed, on the supposition that the condition might be due to gummatous formation. On examination, two weeks after the illness began, a large abscess was discovered, and an operation advised. On removing the testicle a tubercular abscess was found, with tubercular foci scattered throughout the organ, the epididymis being apparently healthy.

It is now eighteen months since the operation and the individual enjoys good health.

In this case there was an antecedent history of syphilis and slight traumatism. The rapid development of orchitis with the formation of the abscess would hardly have led anyone to infer a tubercular infection. It is probable that the tubercular foci were already present in the body of the organ, which gave rise to no appreciable symptoms until the slight injury acted as sufficient cause to lower the resisting power of the structure to such an extent that active symptoms immediately followed.

#### THE PRIMARY FOCUS.

In fifteen cases, the primary seat of disease was found to be located in the testicle, thus verifying the statement made by Reclus<sup>2</sup> in 1876, who states it as his belief that the testicle is often the starting-point of tubercular invasion and that in these cases only about from 5 to 6 cm. of the vas deferens is apt to be diseased. Senn says that this experience does not coincide with his own, he having usually found that the entire cord is involved. The writer's experience is similar to that of Reclus. In most of the cases in which the testicle alone was involved the epididymis was flattened and appeared to be blended with the organ so as to be indistinguishable on palpation. In eight cases the vas deferens was involved throughout its entire length. In five instances the seminal vesicles were secondarily involved, this condition subsiding after castration. The tubercles were found to be unusually large, yellow hard nodules, situated most commonly in the parenchyma of the gland. This condition was first described by Rindfleisch as characteristic of this form of tubercular disease. In five of the cases, miliary tubercles existed. The morbid growth of a testicle in this condition is often very slow and may obtain a voluminous size without being attended by inflammatory symptoms. The tumor is usually periform in shape, varying from a hen's egg in size to that of a large orange. In one instance the growth was the size of the doubled fist. When this condition pertains, especially if there is no involvement of the cord, the differential diagnosis between chronic diffuse syphilitic orchitis, malignant disease, and tuberculosis of the testicle is often

2. Du Tubercle du Testicle et l'orchite Tuberculeuse, Thèse de Paris.

extremely difficult. In not a few of the cases active syphilitic treatment had been employed for some time before the patient came within the writer's cognizance under the belief that the condition was specific in character. If a tuberculous focus in other parts of the body can be excluded and a typical reaction can be obtained by means of the tuberculin test, the condition may be regarded as tubercular. This proof is believed to be of great value in explaining a vague diagnosis in cases where a normal temperature exists and where the tubercular lesion is confined to one organ. When the condition is complicated with hydrocele, a portion of the fluid should be withdrawn, by means of a sterilized aspirating needle and examined for tubercle bacilli; or inoculations of a guinea-pig should be attempted. Specific treatment should always be fairly tried before proceeding to operate in doubtful cases.

#### VALUE OF TUBERCULIN.

The annexed case is of interest as showing the value of the tuberculin test when making a diagnosis.

CASE 8.—G. H.; aged 30; occupation, clerk. Family history negative. Suffered from hernia on right side at the age of 20, which was not followed by any complications. History of slight injury to the right testicle while riding a bicycle 8 months before his present trouble began. Eighteen months previous to his admission to the Jefferson Hospital he observed that the testicle on the right side began to undergo a painless enlargement. The gland was as large as one's fist, pear-shaped, of solid consistency, somewhat nodular at the upper portion; it was hard and elastic; the skin of the scrotum, the prostate gland, vesicles and bladder were normal. The epididymis could not be distinguished from the abnormal growth. The vas deferens was natural in point of size; the inguinal glands on the right groin were slightly enlarged. Malignancy was suspected. The tuberculin test gave a decided reaction. Examination, after castration, showed large tubercular deposits.

#### HYDROCELE.

Of the 96 cases, hydrocele was present in 16, being less by half than the number (one-third) in which, according to Jacobson, the complication may be looked for. Hydrocele was found to be very uncommon where the epididymis alone was involved, it being generally associated with the tubercular condition of the testicle or a tubercular epididymo-orchitis. In several of the cases the tunica vaginalis was much thickened, and in a few adherent to the gland. In no instance was the accumulation of the fluid of hydrocele of very large quantity, the largest amount being met in a case of primary infection of the epididymis; this individual applied to the hospital for the relief for a supposed hydrocele, not being aware that the gland was diseased. In five cases the fluid was drawn and examined for tubercle bacilli with negative results in four instances. Whether the tunica vaginalis was diseased or not it was always removed when castration was performed. Fourteen cases were treated by drainage and the use of the curette; three sinuses of the scrotum, of long standing, leading to a diseased focus of the testicle, received similar treatment. The following were the results obtained.

#### AFTER-HISTORIES OF CASES.

In one case castration became necessary three months after the operation for the relief of an intractable sinus of the scrotum. In eleven cases in which advanced phthisis was complicated with disease of the testicle the drainage in each was followed by a sinus, which did not heal, but was accompanied by a purulent discharge. The evacuation of the discharge was necessary simply as a palliative measure, the physical condition of the individuals being a contraindication to any radical procedure. Most of these patients were lost sight of shortly

after leaving the hospital. A few whose future could be traced lived for a year or so after the operation, dying finally of lung complication. In a case in whom the lung trouble was of recent origin, the individual, after the operation, was sent to Las Vegas, New Mexico, where he resided for eighteen months. When he returned he had gained in weight and strength. The abscess had healed, leaving the testicle slightly enlarged and nodular. All symptoms of lung complication had disappeared. Of the 4 cases where the epididymis was involved, 1 recovered, 1 submitted to an epididymectomy two months later, and 2 were lost sight of after leaving the hospital; when last seen there were suppurating sinuses leading to the diseased organs. In one case the vas deferens, vesicles, prostate and bladder were involved when the abscess of the testicle was evacuated. The person was lost sight of two months after the operation and is in all probability long since dead. In one case marked improvement of the general health followed the operation; when last seen there still existed a sinus in the scrotum attended by a slight purulent discharge.

#### PALLIATION USUALLY UNWISE.

A study of the treatment employed seems to indicate that drainage and the employment of the curette should be reserved for those cases where an extensive tubercular disease of other structures of the body renders anything but a palliative operation justifiable. In all other conditions it is a dangerous procedure and should not be employed. That life may be prolonged and sometimes a cure effected after an operation, by proper hygienic surroundings and removal to a suitable climate, together with the administration of anti-tubercular remedies, is in a measure shown by the benefit which accrued to the patient who was fortunate enough to be enabled to spend a year and a half in the tropics. Occasionally, good results will be obtained by the treatment here described, especially if the tubercular foci are destroyed by the employment of either the thermocautery or an application of chlorid of zinc: a treatment suggested by Lonnget. It is believed that more or less danger arises from the employment from this treatment where a radical operation may be performed. It is therefore not recommended, as it is apt to be followed by an extension of the disease and is always attended by prolonged suppuration, so that valuable time is lost, and an opportunity to perform a radical operation is missed, a secondary infection of other structures having taken place.

It seems to be clear that in cases where there is no contra-indication, the physical condition of the individual being such as to warrant a radical operation, that either the epididymis, testicle, together with a portion or the whole of the vas deferens should be removed, depending upon the extent of the disease. Epididymectomy was chosen where the epididymis alone was involved. In four instances a double operation was necessary. In twenty, the vas deferens was resected at the external abdominal ring. In the remaining five cases the canal was followed down into the pelvis, until the top of the seminal vesicle was reached, and then removed. In performing this operation, the method employed was that suggested by Villeneuve: an incision was made parallel to Poupart's ligament, through the tissues until the peritoneum was exposed, which was pushed aside and the vas deferens followed until the vesicle was reached. The advantage of this operation is that it can be performed by visible inspection.

#### VON BÜNGNER'S METHOD CONDEMNED.

The method suggested by von Büngner of grasping the vas at the external abdominal ring and attempting to

remove as much of the structure as possible by avulsion, is referred to only to be condemned as unsurgical and dangerous; several cases are on record where severe hemorrhage has followed. The complete resection of the vas deferens was reserved for those whose tubes seemed to be diseased throughout their entire length. In a few instances on tracing an enlarged and thickened cord through the inguinal canal, it was observed that when the internal ring was reached the vas deferens became apparently normal in character until it approached the vicinity of the seminal vesicle where it again became enlarged and tortuous. When this condition pertains the vesicle is found to be involved. The contents of the diseased canals usually consist of a white cheesy matter, in which, in some cases, tubercle bacilli are lodged. It is interesting to note that in some instances, where the epididymis was tubercular, that, although the vas deferens was enlarged and thickened, a microscopic examination elicited the fact that the condition was due to inflammatory changes and not to the presence of tubercle. This condition corresponds to what has occasionally been found to exist in an apparently diseased ureter, associated with tuberculosis of the kidney; the enlarged and tortuous condition of the ureter being supposed to be due to tuberculous disease.

#### PARTIAL VASECTOMY.

It is not urged that a total resection of the vas deferens should always be performed, although it is believed that it would be proper to do so. Several instances have come under observation where an enlarged and unsound vas deferens was removed at the external abdominal ring, leaving the remainder, which was apparently diseased, behind. These individuals recovered and have continued to do well since the operation. It is usual with the writer to resect the vas deferens at the external abdominal ring if the morbid condition is arrested at that point. If the disease extends throughout the entire length of the canal, or if the testicle and the vesicular portion is involved, the intermediate structure being apparently healthy, the entire vas deferens is to be removed. In fourteen of the cases operated on the seminal vesicles were apparently implicated, there being symptoms referable to infection of the prostate gland and bladder. In all, the vesicular, prostatic and bladder symptoms disappeared after epididymectomy, except in one instance, where the individual in whom the epididymis was removed, had both vesicles involved. The patient improved in health and strength after the operation, but returned to the hospital four months later with active vesicular and bladder symptoms together with tubercular meningitis, of which he died. No autopsy was permitted. It is presumed that the reason why the portion of the diseased vas deferens which remains after an operation is harmless is that it becomes functionless. It is probable, as has been claimed by Delbet, that the subsidence of the symptoms arises from the circumstance that the purulent products which are derived from the epididymis are cut off, in this manner stopping the supply of irritating material which is constantly being supplied to the vesicles and adjacent organs.

#### RESECTION OF SEMINAL VESICLES.

In view of the fact that epididymectomy, together with the resection of the diseased portion of the vas deferens, will in the majority of instances be followed by subsidence of the prostatic and urinary symptoms, with the return of the individual to health, it becomes a difficult question to determine exactly what cases justify the removal of the seminal vesicles which are sec-

ondarily infected. This question has given rise to a good deal of controversy and is still unsettled. A consideration of tuberculosis of the seminal vesicles not being germane to the subject under discussion, the condition will only be alluded to as briefly as possible. Resection of the seminal vesicles for tubercular disease is a formidable operation and the results have been far from gratifying, most of the cases yielding sooner or later to some secondary development of the disease. Clinical evidence has demonstrated that in a large percentage of cases, where tubercular involvement of the vesicles associated with a primary infection of the epididymis has existed, that complete subsidence has taken place after an epididymectomy; it is believed to be wise to be satisfied with the removal of the epididymis and as much of the vas deferens as may be necessary, taking care to watch the patient assiduously. Should the prostatitis or urinary symptoms continue, resect the seminal vesicles secondarily. From the frequency with which the remaining testicle becomes diseased after an epididymectomy or castration of one side, it would seem that in those instances where both the vesicles and the prostate are probably involved that the wiser course is to combine with the removal of the testicle the resection of the vesicles as well, provided the patient's condition will warrant the procedure. To ascertain whether the vesicles or prostate are implicated may sometimes be determined by the following expedient:

Irrigate the urethra and bladder with a boric acid solution; pass a Swinburne posterior urethroscope down to the prostatic urethra. Let an assistant then massage the vesicles, forcing the secretion directly into the prostatic urethra and into the lumen of the endoscope, which can be collected on a loop of sterilized platinum wire and either a stain or culture made for the tubercle bacilli, or inoculating experiments attempted. If the endoscope is not available the urethra and bladder can be irrigated, and a small quantity of the solution allowed to remain in the bladder. The prostate gland and vesicles are then stripped, a small rubber catheter inserted, and the water drawn and examined. The insertion of the catheter prevents the danger of mistaking smegma bacilli for tubercle—a mistake which, unfortunately, is frequently made. Should the secretion show the presence of tubercle bacilli, it is fair to presume that the seminal vesicles and the prostate gland are diseased.

#### RESULTS AFTER EPIDIDYMECTOMY.

Out of 25 epididymectomies, 11 cases have been followed. One died 4 months after the operation of tubercular meningitis. One developed phthisis 2 years after the operation. One returned 6 months after the operation, needing an epididymectomy on the other testicle with resection of the vesicles. One individual returned to the hospital 3 months after operation with an enormous tubercular abscess of the abdominal wall. This was opened and drained; convalescence was slow; but at this time, 2 years since operation, he is in perfect health. The remaining 7 cases are still in good health, although 6 years have elapsed since the first patient was operated on. Five out of the 6 individuals have had the advantage of fortifying their constitutions by a sojourn in New Mexico or southern California of a year or more.

In none of the cases in which epididymectomy was performed did either atrophy of the testicle or diminution of the sexual vigor follow. It was frequently observed that a painless orchitis followed the operation, which usually subsided in the course of a few days. Out of 55 castrations, 3 were double, all in comparatively

young men. In no instance did any demoralizing effect result from the removal—a condition which is sometimes to be apprehended. Many of the patients in whom castration became necessary, on account of the formation of abscesses and sinuses attended by prolonged suppuration, suffered from tubercular deposits in other portions of the body, so that the operation was merely palliative. The writer has been able to follow the history of 19 individuals on whom this operation was performed. Three died within 5 months after the operation of miliary tuberculosis. One died 2 years after leaving the hospital of tuberculosis of the prostate gland, bladder and kidney. Two died in from 6 months to 4 years of phthisis. One returned in a year for resection of the epididymis of the remaining testicle, together with the vesicles. One year and a half after operation, during which time he has lived in southern California, his general health has been good. One case, 8 months after the first operation, returned for the removal of the other testicle which was the seat of a large tubercular abscess. The remaining 11 patients continue to enjoy good health. The period which has elapsed since their several operations varies from 7 months to 14 years.

#### MENTION OF SOME UNSATISFACTORY METHODS.

A few cases have been reported in which apparent cures of a tubercular focus, located in the epididymis, have followed a ligation of the spermatic cord, depending on the circulation of the tunica vaginalis to nourish the testicle—a method of treatment first suggested by Maucalre. This operation is still on trial, but as it did not appeal to us as a rational procedure it was not employed. We agree with Murphy who, writing on this subject, says: "It is certainly not radical."

It is proper to state that the injection of a 10 per cent. emulsion of iodoform, as well as that suggested by Lannelongue of 3 drops of a 5 per cent. solution of sulphate of zinc into the diseased area were both tried in a number of cases and found to be unsatisfactory. In most instances the introduction of these remedies gave rise to pain, often hastening suppuration, the patient finally requiring a radical operation, and no advantage having been gained by the delay. At least a dozen individuals who have a tubercular infiltration into the epididymis on one or both sides are at this time under observation. In some the condition has existed for several years, yet they seem to enjoy perfect health; in a few instances localized abscesses have formed, which have healed, leaving depressed cicatrices. These patients have each refused an operation.

#### LATENT TUBERCULOSIS.

This condition is considered to be fraught with danger. The constitution seemingly sufficiently fortified to enable the sufferers to keep the disease in abeyance for an indefinite period, yet it is liable at any time to break out and manifest very serious symptoms, the focus of the disease being probably encapsulated. Doyen reports a case where the condition lay dormant in the epididymis for 18 years, extravasation of the urine finally taking place from a tubercular involvement of the urethra. The patient succumbed to miliary peritonitis. Similar cases have been observed by Reclus, Barling, Jacobson, Senn and others. Jacobson, writing on this subject, says: "Occasional encapsulating and partial calcification of caseous deposits in the epididymis must not be looked upon as a sign that the disease is now quiescent, at an end, or no longer a cause for anxiety."

This view is illustrated by the following case:

CASE 9.—The patient was first seen 6 years ago when 21

years of age; he had a quiescent tubercular nodule in the left epididymis. His general health was excellent. Operation was advised, but refused. The individual was lost sight of until five months ago, when he again presented himself for treatment. A tubercular involvement of the testicle, seminal vesicle, prostate gland and bladder was found to exist. It is believed that in all cases of apparently quiescent tubercular foci that a radical operation should be performed.

#### VALUE OF CLIMATIC TREATMENT.

The writer has been frequently told by his western confrères that the cases of tubercular epididymis which come under their care are cured by sojourning in lower California and that operations in these cases is not necessary. Instances are frequently met of these so-called cures where the disease has suddenly become active, extensively involving adjacent organs. In one case which came under the cognizance of the writer, where the primary focus of the disease was quiescent in the epididymis, after living a year in New Mexico, was followed by tuberculosis of the kidney. It is not intended to disparage the benefit to be derived by proper hygiene and a life in a suitable climate, but it is believed that change of climate should not be sought until the primary tubercular focus has been removed. A number of patients have come under observation whose circumstances were such that they were enabled, after submitting to operations, to live an active outdoor life in a climate conducive to strengthening their resisting powers, and to prevent further invasion of the disease. Their present good health, and the immunity from disease which they have enjoyed, are doubtless due to these causes.

#### CONCLUSIONS.

An impartial study of the cases herein recounted seems to warrant the following conclusions:

1. A primary tubercular infection of either the epididymis or testicle may occur, the former being by far the more common.

2. A primary infection of the epididymis, secondarily that of the testicle, is more common than the descending one.

3. Primary involvement of either the epididymis or testicle usually takes place through the circulation, the soil being predisposed to the location of the tubercle bacillus either by a slight traumatism or by some infective condition which has given rise to inflammation of the organ, most commonly an attack of gonorrhea.

4. Secondary tubercular involvement of the epididymis or testicle sometimes follows a primary focus of the disease in other portions of the body, more commonly in those organs that are in a direct anatomic connection with the sexual glands, such as the seminal vesicles, prostate, urethra, bladder, ureter or kidney.

5. The invasion of the testicle may be rapid, associated with acute inflammatory symptoms, an abscess soon developing; or the onset may be slow, the symptoms simulating those of either chronic syphilitic orchitis, or malignant disease of the organ.

6. The tuberculin test should always be employed in doubtful cases where only one focus of the disease is known to exist.

7. In doubtful cases associated with hydrocele, the fluid should be examined for the tubercle bacilli and inoculating experiments made.

8. The injections of either emulsions of iodoform or of sulphate of zinc into the diseased part are not to be recommended.

9. In all cases of encapsulated caseous nodules quiescent in the epididymis, epididymectomy should be performed.

10. Epididymectomy together with resection of the vas deferens is not attended by either atrophy of the testicle or sexual weakness.

11. The drainage of tubercular abscesses followed by the use of the curette is only to be employed where radical treatment is not permissible, as it is attended with more or less danger and is generally unsatisfactory in its results.

12. In instances where the epididymis alone is involved, a resection of the diseased structure is all that is required; whether a partial or complete resection of the vas deferens is to be undertaken is still undetermined.

13. Double orchidectomy should be performed when both glands are diseased, provided there is not extensive co-existing tubercular infection of other organs.

14. Whether infected seminal vesicles should always be removed at the time that the epididymis or testicle is resected is a question open for discussion. From the fact that in a large majority of cases the removal of the primary seat of the disease is followed by a subsidence of the tubercular involvement of the vesicles, it is deemed wiser, as a rule, to wait and remove the vesicles later, if necessary.

15. Hygienic and climatic influences play as important parts after operations in fortifying the constitution against further invasion as they do in other tubercular conditions.

16. The anti-tubercular remedies are of great value in controlling the disease and should always be employed in conjunction with whatever surgical procedure may be deemed necessary.

#### WHAT OF THE FUTURE?

CHAIRMAN'S ADDRESS, DELIVERED BEFORE THE SECTION ON OBSTETRICS AND DISEASES OF WOMEN, AT THE FIFTY-THIRD ANNUAL MEETING OF THE AMERICAN MEDICAL ASSOCIATION, AT SARATOGA SPRINGS, N. Y., JUNE 10-13, 1902.

J. H. CARSTENS, M.D.  
DETROIT, MICH.

This question we may well ask ourselves, for we certainly will have other things to do than to take out tumors and diseased tubes. The obstetric part of our section has virtually been settled. Obstetrics is based on purely mechanical laws, and in the vast majority of cases nature needs no help. The small percentage of abnormal cases that require the assistance of the obstetrician are now well understood. The patients are under observation from the beginning of pregnancy, many of the cases which would be serious are recognized before that time, and by the induction of premature labor and other methods many of the more severe cases, I might say severe confinements, are prevented.

Even the severe cases that are allowed to go on to full term can be delivered safely, for mother and child, by Cesarean section. The dangers of the physiologic process of confinement are now virtually nil.

Formerly one woman out of forty died, to-day, as reported at the Preston Retreat, 1,000 cases without a death. In private practice 500 and more cases have been reported without a death, and the other day I saw in a journal that at a lying-in hospital there had been 1,900 consecutive cases without a death, hence it seems to me that I can truthfully say that the moot questions in the obstetric part of our Section have virtually been all settled.

As our program shows, very few papers are presented on this subject. I have urged a number of members to write papers on this subject especially, so as to make

some kind of show for obstetrics, but it is hard work. Every possible abnormal condition has been dilated on and from so many different standpoints that it is almost impossible for anyone to write a paper without repeating what has been said many a time before, yes, it is even difficult to write a paper that presents a subject from a slightly different angle; hence, no one wants to write a paper that is simply obstetric literature; consequently all our papers are on gynecology, and what kind of gynecology? Not that of the past, of Ferguson's speculum and the application of tincture of iodine and leeches and tampons and douches with occasional perineorrhaphy, no, that kind of gynecology is past. The papers we have to-day are the papers of mechanics, of surgery of the pelvis, the removal of tumors, the removal or partial removal of the uterus, ovaries or tubes or the anchoring of the same as nearly as possible in the normal condition if they are displaced. In the last few years our special effort has been to preserve as much as possible the generative organs, where formerly we were more anxious to remove them entirely; now we select our case most carefully and preserve the whole organ, or, if we cannot do that, we preserve as much as we possibly can.

The various moot questions in this branch of our Section, that is, the gynecologic, are consequently also being settled. Very soon there will be nothing more to write about. With the thousands of workers in different parts of the world, a little is added here and a little there, and soon all disputed points will be made clear and settled, and what then? Our Section's work will be done, very little new can be presented and few papers will be reported; very rare cases only or resumés of some subject. We have nearly arrived at this point, and therefore I throw out the question: "What of the Future?"

The general practitioner of the country is the one who attends the cases of confinement occurring in his neighborhood. Some of us may drift into the ranks of the general practitioner; the other part of our Section, of the surgical habitus, swing off and join the ranks of the general surgeon, and but little more will be left of our Section.

That will be the end unless we find something else that could be properly brought before our Section and that we, with our experience with women, could properly handle, discuss and settle in the interests of the race.

When we consider that nation which has been the mighty ferment and a great factor in the civilization of the race during the last three centuries, when we consider that France is a decadent race, has virtually reached its limitation of growth, that without emigration its population does not increase, there is food for thought.

When we consider that England is beginning to get in the same condition, that even in Germany the proportion of children to the families is very decidedly diminished, then we can easily see that there is other work for the gynecologist and obstetrician.

In our own country the decreasing fecundity of American women is so well known and has reached a stage where barely one child is found in the family on an average, and when we consider that the New England states have not grown—in fact, would have decreased in population were it not for the influx of foreign population and by the admixture of new vigorous blood—when we furthermore consider that even this very prolific foreign element in one generation has its fecundity diminished, the question becomes a serious one.

Malthus, more than a century ago, was afraid that the world would be over-populated, but he did not under-

stand the process of evolution and that nature always provides means to prevent over-production.

We to-day may not believe that a nation should be gauged by the number of inhabitants, but rather by the mental caliber of its citizens, still we cannot ignore the fact that mental caliber without physical vigor is a very serious state of affairs. With the physique kept up at the highest point, mental improvement should go on as required by advancing civilization.

When we consider that a young woman who is married insists on not having children right away or having children later in life, that she makes use of every possible trick to prevent or destroy pregnancy, thus ruining her health and destroying her power of reproduction at a later period when she is so anxious to have children and has found out that life is hardly worth living without children—without some object or aim to live for—when we have this old question brought to our attention we can readily see that there is something for us to do besides operating.

When we consider that lack of moral training that is often given by a selfish mother, who says before marriage: "I do not want my daughter to be troubled with children," we may well despair in our efforts. Then we can easily see that the work we may do in the medical societies, and of which the great public hears nothing, is of very little use, unless we, as individuals, each in our respective community, forge to the front and see that education and a higher and nobler standard of womanhood is inculcated in the mind of the rising generation.

When we consider that in a republican form of government all are equal and that all soon become ambitious, all want to shine, all are striving to get the best education obtainable, that some parents are denying themselves so that their children can acquire a better education and that the young people do all kinds of work and struggle along as well as they can, so that they may obtain an education, then it can readily be seen that the resulting product of such educational system will not be evenly balanced, there must be a disproportion between the physical and mental condition, hence not a normal condition, or there must be a degeneracy of both the body and the mind.

We know that when a highly civilized nation comes in contact with one which is low in intellectual development, that the latter nation will go under and finally be exterminated. It is the inability of the lower to keep pace with the rapid strides of the more enlightened nation. The change and the demand are too great and sudden.

The same thing occurs with individuals who have no hereditary tendency to mental training. If for generations the life has been a monotonous one, like "the man with the hoe," you might say, and you try all at once to educate the brain to the highest degree, something will give away—it should be gradual, little by little, generation after generation, and then the system can adjust itself to the various conditions required.

Take our school system: the children are stirred up to ambition, are urged to set their mark high and all to become teachers, lawyers, ministers and physicians. They have but one trait of the mind, ambition, but they have no mental capacity, cannot grasp principles, they learn with great difficulty, they forget easily, and in order to keep up they must study, and study hard. They work after school hours, yes, work to 12 and 1 o'clock at night. They get up early in the morning to review their lessons before school hours, and the result is inevitable. Insufficient sleep, hasty meals and lack of

exercise will produce a partly educated mind and a physical wreck.

If such a person be a female it is all the worse. If such education is without much effect on the body up to puberty it certainly will be after. The tremendous demands made on the organism during the stage of rapid development from childhood to womanhood requires that the strain on the brain by excessive study should certainly be lessened, especially so during the menstrual period. There seems to be no provision made anywhere in our schools for this, and the more I see of it the more I am inclined to think that somewhere a change should be made.

Either there should be an absolute separation of the education of the sexes at puberty or the education should be so elastic that the young woman should be allowed to leave school for a few days or a week during every month without it being charged up to her or putting her back from her place in school. This is the point I think that requires our serious consideration. If the woman is of the age when she is fully developed physically, her menstrual function firmly and fully established, then there will be, probably, no objection to co-education. It is during this stage of development, it seems to me, that the great mischief is done.

I think the tremendous strain on the brain at this period required by our educational system must certainly effect the physical condition, and the result is, in many cases, neurasthenia, hysteria and broken-down women whose capacity for reproduction is very limited. If there is a puny child born it will probably go through the same course that its mother did and be physically worse.

This great problem so affecting the future of the race should receive our serious consideration. There are many other points in connection with this problem. The boy is less affected by that kind of training as his sympathetic nervous system is less called on than that of the female. Besides he has greater liberty of action, has more out-door exercise and grows up to vigor and manhood. When he marries one of the women with the educated mind, which he admires, and a broken-down system, which he does not see, it will only take a short time for him to see the mistake he made.

He is strong and robust, with sexual vigor, she is weak and without passion, and it will not take long for trouble to arise. She is glad to be left alone as much as possible, and he finds company somewhere else. He picks up disease and gives it to her, and then we are called upon to remedy the trouble. Many women have told me that they were glad that their husbands let them alone and went somewhere else, they were perfectly satisfied. Think of such a view of life.

In this connection I might mention the question of prostitution. Venereal diseases are spread in many places and ways, but no doubt principally in brothels, especially of the lower kind. We must discuss this question thoroughly and come to some conclusion and then go before the public and insist on how it should be managed and controlled. Public opinion is adverse to regulation and control, but I see no other way to prevent the spread of private diseases. We must first clear up this question in our own minds and then educate the public.

Again, we find another condition where a young, vigorous woman, with the right kind of brains, grasps things properly, will go through the same educational system quickly and lightly, with plenty of time to thoroughly masticate her food, plenty of time for exercise and fresh air. She passes through it with a fine trained mind and healthy body. She has ambition. She marries a rich but older man. The man is past his prime, this

woman, strong, passionate, with a natural desire for a family, finds that she has made a mistake. She is suffering from sexual passion, super-abundant vitality which should be given vent by child-birth and lactation, and which is suppressed until nature rebels, and there is an explosion somewhere. She also ends with neurasthenia, hysteria, insane asylum, morphin or whisky.

When we consider that next to self-preservation, the preservation of the species is the strongest law of nature and that it permeates every organized being, from the dull monad of the primeval sea to the complicated organism of man, even increases with each higher nervous organization, then we must see that erotism plays a very important part in the life of a human being. We all see cases of young women suffering from ungratified sexual passion who perhaps do not even know what sexual intercourse is.

Holy horrors! This is a tabooed subject and must not be spoken of; it is dirty; it is vulgar. "To the pure all things are pure." We must speak of these things. We must learn about them and understand them, and then we can show the public at large what is normal and healthy. Only when we understand this ourselves can we find a remedy for the many abnormal or pervert conditions.

There is a history of another kind; with advancing civilization, if you can call it advancing civilization; there is the struggle for the mighty dollar; there is the ambition to shine, to appear big, to appear smart and rich. Young women want to marry a man with money or a large income. Young men see what women demand in the way of finery and style, that with a modest income they cannot afford to marry, so they postpone it until later in life, and women are thus thrown on their own resources when the parents become feeble and old and die. They must work early in life, the parents plan to give them a training or education where then can make an honest living, and they are all struggling for the highest positions that they can get; that of teachers, nurses, stenographers, bookkeepers, etc.

The competition in these various professions is great, all are getting overcrowded; every young woman wants something of that kind, none of them want to do housework. In order to prevent an overflow the requirements for all these positions are raised higher and higher year by year. Greater mental capacity is demanded to acquire the knowledge for any one of these more learned professions. When the knowledge is acquired the patient is broken down. Many fail in their calling which they have chosen, they made a mistake, they should have been something else. It is for us to solve this question of mental capacity and shove men and women into that direction, into that channel of activity, for which their mental and physical capacity is most capable.

This should be one of our great works to study and elucidate this great problem of the proper vocation of each individual. As a rule, all these kinds of persons finally become drones in their chosen position, filling it competently, but, as a rule, keep on the even tenor of the way, although "hope springs eternal in the home breast," but few find the hero of their ideal, few get married and thus live an unnatural life. Somewhere the nervous system will be unhinged and, although nature is wonderfully kind and compensating for weaknesses and defects, there is a limit even to nature, and after a series of years, generally during the period of the menopause, something snaps, some part of the system gives way and an invalid is the result.

It may be uphill work, but we must help to eradicate this notion that men can be gauged only by the number of the mighty dollars they have and not by the good they do.

In this connection I might call attention to another point that seems to be overlooked, and that is the everlasting suggestions to young girls about their pelvic organs. A young girl will grow up, have menstruation established and have no trouble, but as the result of suggestions from her mother, sisters or others, she may develop trouble. Always being asked if she has any pain, and wondering that she has not; asked if she has any discharge, and wondering that she has not; always being asked about the excessive flow—these constant suggestions, this constant calling attention to the womb and ovaries, will make the young girl think about her menstrual function, and a slight deviation from the usual will, after a time, attract her attention, and she will begin to think about it more, and, as congestion of any part of the body, say the hand, can be brought about by having the mind dwell upon it, so congestion of the pelvic organs can be brought about by thinking of it, and congestion is only a pre-stage of inflammation and pathologic changes.

With this thinking and worrying about the disturbances we have gynecologic tinkering, and then we have but one step more to chronic invalidism. It makes my heart ache when I see young girls and women subject to local treatment, injections, supports, etc., for months and years, when all they need is a normal mode of living, proper food and proper exercise. A little hyper-secretion from the glands of the mucous membrane of the vagina or the uterus does not require local treatment always; it needs the treatment of the physiologist, that is all. I do not want to derogate proper local examination and treatment in special cases, what I protest against is the zeal with which this is carried in in simple ordinary cases.

More physiology is needed. We have all had patients come to us from a distance of hundreds of miles, expecting to go under a serious operation. On examination we find that all they need is to drink three pints of water a day, and with this advice we often send them home disappointed.

We have all had patients come to us from a great distance who were suffering from auto-infection, the result of constipation, and who need, instead of an operation, a proper regulation of diet and vigorous abdominal massage.

Many of the nervous cases sent to us, who are supposed to suffer from reflex-neurosis, are found to suffer from some of the protean symptoms of syphilis which have been overlooked because they are the latest manifestations found in the third generation and which are easily remedied by constitutional treatment.

How many brain diseases and diseases of the nervous system have been considered due to pelvic troubles simply because the patient was a female; every case of consumption or Bright's disease and every dyspepsia or appendicular colic; everything is supposed to be due to the diseases of the ovary or the uterus, if it occurs in a woman.

How we must constantly be on our guard and be broad general practitioners if we do not want to get in the path of the narrow specialist; to simply know a little part of the body, but forget the great wonderful complicated mechanism of the whole human organism.

In answering the question, "What of the Future?" I would say that we must have more papers and more discussion on the subjects to which I have called atten-

tion. We must get closer to the people in general and do more missionary work from house to house.

We must discourage the constant tendency of suggestions to young girls and women about the menstrual function. We must teach that this physiologic process in a healthy body will be taken care of by nature without artificial assistance.

We must see to it that the young woman has a sound body if she wants to acquire knowledge; that it is more important to have a healthy body than to possess great learning. We must oppose the cry that too much is being taught in our higher schools or the universities, that the demand on the mind is too great, as that is entirely wrong. We must teach that everybody was not born to attain this higher education, that only those should attend the higher institutes of learning who have the attributes of the mind which enable them to learn easily and quickly, and that even these require plenty of exercise and fresh air.

We should insist that gymnastics and systematic physical exercise should be taught in every school of the land, from the lower to the highest, and that the curriculum of study should embrace the most systematic course of gymnastics to produce a sound body with a sound mind.

We should thoroughly study the effects and the results of erotism on the human body. We should study how we can more thoroughly bring about a more perfect marriage relationship and prevent the frequent mismating, as shown in our courts.

In fact, we must more thoroughly study the exact positions of individuals, every combination of physical and mental condition and their most fit place and most proper vocation in life. We must branch out, we must look ahead, we must be the counsellors and the guides of the race in the future.

## PHYSICAL DIAGNOSIS AS RELATED TO DENTAL COLLEGE CURRICULA.

CHAIRMAN'S ADDRESS, DELIVERED BEFORE THE SECTION ON  
STOMATOLOGY, AT THE FIFTY-THIRD ANNUAL MEETING OF  
THE AMERICAN MEDICAL ASSOCIATION AT SARATOGA  
SPRINGS, N. Y., JUNE 10-13, 1902.

A. H. PECK, M.D., D.D.S.  
CHICAGO.

In view of the fact that during the past two years a number of the state boards of dental examiners throughout the country have added the subject of physical diagnosis to their list of studies, which must be passed to secure a license to practice dentistry in their respective states; also, that I have for some years been impressed with the desirability and, I may say, the necessity, of adding this subject to our dental college curricula, I concluded this would be as fit a subject as any for my paper at this time.

Heretofore this subject, whenever taught at all, has received what I may term unconscious attention from various teachers; that is to say, in the regular teaching of their departments they have naturally referred to phases of physical diagnosis, but not until the past year has the subject been made a separate department and a complete course of instruction given.

The knowledge of man has steadily increased, keeping pace with civilization. Man has been brought to a higher plane through scientific investigation; his mind broadened and ripened in the fields of research. The furtherance of their profession and the elevation of their fellow-men have ever been uppermost in the minds of the great men of the past.

As you are familiar, it was discovered ages and ages ago that teeth were filled with pieces of wood, ivory and other materials, as evidenced by the researches of the catacombs of Rome and Naples, thus assuring us that the art of preserving teeth was known to our ancestors of those very early times. Unfortunately, however, we do not know who the great dentists of those ages were, as the records of this work have been lost. Had this work been entirely satisfactory to these dentists and their patients, the latter being pleased and contented with such operations, our profession would never have attained to its present high, enviable position in this professional world.

Dissatisfaction with prevailing methods, and the laudable desire to excel, set men to thinking and to doing, the result being that dentistry has developed from a humble trade to an honored profession, affording a field for usefulness to thousands and whereby the suffering of the entire civilized world can be and is, in a great measure, alleviated.

During the past few years the courses of study have been lengthened in all professional schools. Only a short time has elapsed since a medical student could graduate after attending two courses of instruction of six months each, but now one is required to attend four years of nine months each, after having gained a good scientific or classical education as a foundation upon which to build his professional knowledge, thus requiring from six to eight years of college work to receive his degree of doctor of medicine. Let us not forget that dentistry has by no means been slumbering all the while, for the educational requirements for admission to a dental college have been steadily advancing, and the number of years and length of terms increasing, until now schooling equal to the second year of high-school work is required, and in another year four years of seven months each will be required.

Only a few years ago a student received a few lectures on physiology, when that part of his course was considered finished, but now it is one of the most important branches he has. Histology, pathology and bacteriology have become important subjects, and the dentist would also be considered very lame without a knowledge of anesthesia and oral surgery. More than this, the amount of practical work that must be done as a part of the dentist's preliminary education has more than doubled. What is the object of this advance? It is that his knowledge may be broadened, extended and that he may be placed on a higher plane with mankind, as well as that he may be better able to satisfy himself and his patients after engaging in the practice of his chosen profession.

We, as professional men, are continually being called upon to give opinion as to the etiology and prognosis of certain diseases, and who will attempt to gainsay the statement that this we should be not only willing but able to do, and it is imperative that we be as nearly correct in such counsel as possible. At times we find this easy, and again it taxes us to the limit, if not beyond; all our knowledge and reason is called into play before we are able to make definite statements.

It is not always an easy matter to tell just how much vitality a patient has, nor how much of a nervous shock one can endure, nor how long one can remain in a dental chair at a sitting without sustaining material injury. This we, as dentists, should know, so that our patients, on leaving our offices, will have received professional benefit instead of injury.

Who of you have not seen or are not cognizant of neurotic patients who were nervous wrecks for days after

having had a large amount of dental work done? With the requisite knowledge and the exercise of forethought and judgment, all this can be avoided. A few more sittings of shorter duration would have completed the work, at the same time acting as a stimulus rather than a nervous shock. This knowledge we can gain only by a thorough study of our patients, and an understanding of the cause or causes of their ailments.

"I hope to see the time when a dentist will inquire into the health and symptoms of his patients before deciding on the amount of work that is proper and safe to be done at any one sitting, as should a physician before prescribing a certain amount of a drug or drugs that are to be given for an ailment of the patient.

To judiciously outline our work we, as dentists, must have as thorough a knowledge as possible of the various diseases of mankind, especially those affecting the vital organs or those organs most likely to suffer when shock is inflicted. The symptoms of these diseases, also the physiologic changes that may occur, are necessary to be understood. Who of us would keep a patient, afflicted with organic heart disease, in our chair for an unusually long and fatiguing operation if we be able to inform ourselves of the true condition of these parts.

There is only one way for us to gain this knowledge, and that is for us to familiarize ourselves with the normal heart, as to location, size, beat, rhythm and sounds, thus enabling us to recognize pathologic conditions when present. How embarrassing it must be for any dentist, after advising the administration of a general or local anesthetic, to be told, on consulting the family physician, that such a course would mean certain death to the patient, whether true or not.

Physical diagnosis is the term used to designate those methods which are employed in the detection of disease during life by the anatomic changes produced by it. The nature and extent of such changes can only be recognized and appreciated by the divergence which they cause in the affected organs from the known physical condition of these organs when in health.

The significance of physical signs in disease cannot be determined by theory; only by clinical observation confirmed by observation after death can this significance be determined.

If it be granted that it is at all desirable that the dentist shall possess this knowledge I am talking about, it at once becomes evident that he must enter into a systematic and thorough study of the only methods by which these physical signs can be determined in the living subject, and these methods are: 1, Inspection; 2, palpation; 3, mensuration; 4, percussion; 5, auscultation; 6, radiology.

Some of these methods have been in use for many centuries. Palpation, for instance, was used in the Neolithic or polished stone age, 1500 B. C., to demonstrate the presence of fluctuation, while radiology is practically new. This method is the outcome of the discovery of the x-ray, by which, with the use of the fluoroscope, tumors or solid bodies are located in various parts of the body, that were impossible of discovery before. Fractures of bones, the exact kind and position, are determined by looking at the bone direct. Tumors of the internal organs are observed by this means, thus enabling one to diagnose conditions which were impossible of discovery before the x-ray was in use.

One must also be conversant with the various areas into which the body is divided, and which are bounded by definite anatomic relations. This is necessary that one, being familiar with the normal size and location of

an organ, can determine whether it is in its proper position.

It is necessary to know that the first area from a physiologic standpoint is the supra-clavicular region; and that this area is definitely bounded below by the inner three-fifths of the clavicle, internally by the trachea, and superiorly by a line extending from the junction of the outer with the middle third of the clavicle to the top of the trachea. Also, it is necessary to know that normally within this area are to be found the apex of the lung, the carotid artery, the subclavian artery, the subclavian vein and the jugular vein.

Next below this is the clavicular region, which is that part of the thoracic cavity lying back of the inner three-fifths of the clavicle. An understanding of the anatomic boundaries and contents of this region is also necessary, but with which I shall not inflict you in this paper.

The most important regions, from the standpoint of the dental practitioner, are the following: Infra-clavicular, the boundaries of which must be carefully studied, that one may recognize the presence of the vital anatomic structures and organs in their normal positions. In this region are to be found, on the right side, lung tissue, the ascending vena cava, the right bronchial tube lying back of the sterno-costal articulation and also a small portion of the arch of the aorta. On the left side are found the pulmonary artery from its origin to its bifurcation, the left bronchial tube lying a little below the second sterno-costal articulation.

The next region of special importance to the dentist, and which lies immediately below the preceding one, is called the mammary region.

The lowest region in the anterior aspect of the thoracic cavity is called the inferior mammary.

Centrally located is the sternum, this area being divided into three regions: (1) The supra-sternal; (2) the upper sternal, and (3) the lower sternal.

The back is divided into three regions: (1) The supra-scapular; (2) the infra-scapular, and (3) the inter-scapular.

All these regions should be carefully studied, as indicated above, in the two instances in which the boundaries and contents are stated.

A knowledge of the size and exact location of the heart is especially important. In the average subject the base of this organ is found at the second intercostal space, the apex beat or the maximum impulse being at the fifth intercostal space, from three-fourths to an inch to the left of the sternum. It must be understood that the apex beat does not locate the apex of the heart, the latter being about an inch to the left of the beat.

The anatomy of the heart must be studied. It is necessary to know that there are four different valves, and what is expected of them in the performance of their normal function, and that the positions on the chest where the sounds made by the valves can be most distinctly heard are not immediately over the organ.

I thus briefly outline this foundation work that there may be no mistake as to what I consider necessary in the schooling of prospective dentists, that they may be able intelligently to apply the six methods of eliciting the physical signs of the various pathologic conditions of those diseased organs bearing directly on the practice of dentistry.

It is also necessary to be thoroughly conversant with the meaning of these various methods of physical diagnosis, how each is to be employed, and what is to be learned by it; that inspection means only that which can be determined by looking at the patient without further means of diagnosis; that palpation means the examina-

tion of the parts by the laying on of the hands, and in this method only the tips of the fingers may be used, or the palms of the hands as a whole; that with mensuration certain facts are to be determined by the process of measuring; that by percussion is meant the tapping of the chest to elicit certain sounds under the varying conditions; that there are different methods of percussion, the immediate and the mediate; that auscultation is the act of listening for sounds within the body, chiefly to ascertain the condition of the lungs, heart, pleura and other organs; that there are different methods of auscultation, the immediate, which is the application of the ear directly to the part, and the mediate, which is by use of the stethoscope. The pulse is such an accurate index to many of the lesions of the heart, it is necessary that one shall understand it in all its variations.

Thus would I have dental students instructed. I trust this paper will receive full and unrestricted discussion, for I want to know whether, in your judgment, this branch should be added to the curriculum of our dental institutions of learning.

This is a subject that has engaged my attention for some time, and it was my desire more than two years ago to present this subject to the profession and urge its teaching in our schools, but listening to the advice of trusted friends that the time was not ripe for it I desisted. During the past year it has been taught in the institution with which I am connected.

As I see it now, I cannot understand how anyone can advise otherwise.

I hope to see prospective dentists so instructed in the future that they shall be able to recognize diseased conditions of at least these vital organs, and thus be enabled to avoid serious and possibly fatal mistakes. When this knowledge is acquired and successfully practiced, the dentist at once gains the implicit confidence of his patients, his word with them becomes law, and his opinion is sought and respected. Such a dentist is a real benefactor in the community in which he resides and his success is assured.

He also has the satisfaction of knowing he is one who has participated in that "higher education," the practice of which can only result in assisting to elevate the standard of his profession, and to place it on a higher plane in its relation to other progressive professions.

## THE EMBRYOLOGY OF THE DENTAL PULP.\*

R. R. ANDREWS, A.M., D.D.S.  
CAMBRIDGE, MASS.

At the invitation of the secretary of our section to present a paper on some subject connected with the dental pulp, I shall consider at this time the dental pulp in its embryologic aspect. Such an aspect appeals to me the more strongly from the fact that I have given special attention in earlier research work to dental embryology. In a general way, I shall consider the growth of the dentine germ from the earliest signs of its development, the formation of the dentine from the germ, and lastly, the fully formed and functionally mature pulp. This subject may not offer anything that is particularly new, but there are several points that I have recently been trying to clear up, and a discussion of them may prove of general interest to the Section on Stomatology.

At about the end of the second and the beginning of the third month of intra-uterine life, in the embryonic

tissue of the jaw, we shall find the primary specialization of cells which are to form the dentine germ, and from which come the cells which afterwards form the dental pulp. It is in no special zone or layer of this connective tissue that the dental germ is formed, but the formation seems wholly influenced by the contact with an enamel organ. In the presence of this organ, the connective tissue cells become stimulated and active. It would appear as though they offered a resistance to its further growth, and from this resistance the enamel organ was made to expand, thus becoming flattened and broadened. The stimulation and activity of the cells is shown by their rapid growth, which clouds the part at this point, becoming a dense focus of new growth. The tissue is seen to be actively building itself up, and this results in the formation of a papilla, around which the enamel organ is growing like a cap or helmet. This process of new growth is a beautiful illustration of anabolic metabolism. The papilla grows to a cusp or cusps, and now becomes the dentine germ. At the end of the third and at the beginning of the fourth month, the dentine germ is rather a homogeneous structure. Round cells are very numerous; they have relatively large nuclei and nucleoli. As the germ assumes the cusp shape, multiplication of cells takes place around the blood vessels, which have grown into the base of the germ, and a jelly-like layer has formed around its outer surface. It will be found that the dental germ will grow into the depressions of the enamel organ of a bicuspid or molar tooth, and these growths will become the dentine cusps. We also notice that the different layers of the enamel organ are now formed, and that the sacculus is now forming its layers about both enamel organ and dentine germ. When this process is completed, these are enclosed in a sac, and thus become a dental follicle. Within the area of the dentine germ are contained all of the cells which shall develop later into the mature dentine, and into the pulp of the fully-formed tooth.

The round cells around the rim of the dentine papilla appear to be in a protoplasmic substance, sometimes called a zone of amorphous material. It is a hyalin structure on the outermost surface of the germ. The cells just within become richer in protoplasm, and many processes are seen to be forming from them. They are becoming branched cells, a little later the cells at the surface grow larger and assume a columnar shape which may be caused by mechanical compression. We also see just within this layer of cells some that are pear-shaped, conical, cylindrical, and spindle-shaped. There are some authorities who have spoken of what they call elementary cells on the outer layers, and from which they say the odontoblasts are formed, but I have never observed anything but globular masses that are not cells, and which are found in the protoplasmic substance of the rim spoken of above. At the beginning of the fifth month these cells on the surface are seen to be undergoing a histologic differentiation, as stated above, and are becoming specialized or formative cells, the odontoblasts. They are membraneless and little more than masses of protoplasm, which are seen to be filled with great numbers of bright, glistening globules of different sizes. The so-called "conjugation cells" of the German authorities are what I believe to be the pear-shaped fiber-forming cells. These are seen to be sending their processes into the intercellular spaces of the odontoblasts, and thus I believe the fiber to be formed. At this time dentinification is about to begin. How does this process of calcification take place? This

\*Read at the Fifty-third Annual Meeting of the American Medical Association, in the Section on Stomatology, and approved for publication by the Executive Committee.

we do not wholly understand, nor do we understand the chemical or physical properties of the building materials. At this time the blood supply is evident, and at the seventh month there is a perfect vascular system consisting of arteries, veins and capillary network.

As I have said, the details of the vascular mechanism by which the odontoblasts are supplied with lime necessary to form calcified structure have not as yet been clearly worked out. Capillaries near the formative cells do not communicate directly with the cells, and must therefore pass the lime through the intracellular substance. The inorganic calcium which is necessary, manifestly cannot be supplied as such by the organic formative cells, but must make its initial entrance into the body from without. This entrance in the fetal state must necessarily be through the maternal circulation, and after birth it must come from the food which passes through the alimentary canal. From here it must be carried to the specialized formative cells which superintend the process of dentinification, and there is but one such distributor, the blood supply.

After the absorption of food into the circulation by the intestinal epithelium, chemical analysis of the blood shows the presence of two calcium salts, the insoluble phosphate ( $\text{Ca}_3(\text{PO}_4)_2$ ), and the soluble carbonate ( $\text{CaH}_2(\text{CO}_3)_2$ ). It can be readily understood that the soluble carbonate can be absorbed, but how the insoluble phosphate can be absorbed is still a mooted question. It is believed, however, that it is absorbed in that same loose chemical combination with proteid in which it is found before absorption in the casein of milk, and the yolk of egg. Chemical analysis has shown these two foods to be very rich in calcium. The casein and caseinogen of cow's milk, according to Bunge, contains more calcium to the liter than does lime water. Caseinogen, according to Soldner, contains 1.65 to 2.36 per cent. of calcium. The proportion of calcium in combination with the proteid of egg-yolk has been found to be about the same.

The loose calcium-proteid combination, arriving during its passage through the dental pulp capillaries, within the radius of the special physiologic motive force of the odontoblasts, is acted on by this vital force, and thus becomes ingested by the cells. We believe that it here becomes modified by the cytoplasm of the cell, by a chemical combination with its organic substance, and in this way calco-spherites are formed. Within the cells these globules seem to have the property of coalescing, and as they are placed by the cell against the surface to become calcified they are found to be in many cases large globular or irregular-shaped masses. These masses, merging with others, smooth out and form the layer always found between organic and calcified tissues, where the process of calcification is taking place. This is the layer known to investigators as borderland tissue. Hoppe-Seyler asserts that the lime which hardens bone, dentine and enamel is a double salt of carbonate and phosphate of calcium, having the formula  $\text{Ca}_{10}\text{CO}_3(\text{PO}_4)_6$ , one equivalent of calcium carbonate with three equivalents of calcium phosphate.

The various processes of dentinification have been demonstrated to me by many hundreds of sections cut from developing teeth, at a time when calcification was beginning, and from tissue prepared as near the life of the animal as it could be, and prepared with the least possible manipulation consistent with perfect specimens.

The formation of dentine from the dentine germ proceeds substantially in the following manner: We notice that the hyalin substance on the rim of the germ, which

is a protoplasmic basis substance that surrounds the outer ends of the formative cells, is filling up with glistening, irregular-shaped masses that appear semisolid, many of them being globular, but all tending to form a layer of substance which is involving a portion of the outer ends of the odontoblasts. We notice that these cells themselves are filling with bright, but minute, globular bodies, which are the calco-spherites, that seem to have their origin within the cytoplasm of the cell; these grow larger, probably by merging with others, as they are conveyed to the calcifying surface of the layer of the rim. Mr. Mummery of London has described a network of connective tissue fibers which were seen in bundles between the odontoblasts, and even enveloping them and passing out from them, forming a network just in advance of the main line of calcification. This network of fibers, the fibers of Mummery, serves, during the formation of the layers of dentine matrix, as a scaffolding, among which the gelatinous tissue and the calco-spherites are deposited. I have described a similar network in developing enamel, in a paper read in Berlin in 1890. In this way the calcifying layers are formed until the dentine is completely calcified. This process is not continuous, but occurs in laminae, as indicated by the contour lines seen in the forming specimens that have been stained. The layer which is forming is a new product in which the lime is held in some sort of a chemical combination. In this condition it is known to be calco-globulin, and a further chemical change forms it into the fully calcified structure. Thus the dentine is formed, layer by layer, and stage by stage. We cut our sections, if we are studying the forming dentine, at a period of growth covering one of these stages, and we do not always get the same picture. Sometimes our section will show the globular formation stage, sometimes in the stage that shows the continuous band of calco-globulin, and sometimes, though rarely, we get a picture that shows no appreciable layer between the odontoblasts and the calcified dentine. Sudduth has stated that the thickening of the dentinal wall is accomplished by a single layer of odontoblasts which begin the process, and these same cells persist throughout the life of the pulp. I cannot, with my present knowledge, agree with this statement, for I have seen earlier layers of odontoblasts being apparently used up or engulfed within the layer forming, and other formative cells developing from the cells of the pulp tissue just within. Oblique sections of forming dentine, and of the layer of borderland tissue, also show parts of the formative cells which have become fused with it. Dr. Frank Abbott makes the statement that he has seen from time to time dentine forming cells replaced by others, which, he says, are seen to be forming at their inner side. The layer of calco-globulin has been called collagen; I do not believe that it is collagen. It was also formerly known as the "membrana preformativa," but this is not a membrane. The layer of odontoblasts was also known as a membrane, the "membrana eboris;" neither is this a membrane.

Morganstern calls the layer of borderland tissue "dentinogenous substance," and thinks that it is produced by the odontoblasts giving up part of their substance, and that a segmentation of the odontoblasts has taken place, somewhat as the enamel rod is formed into segments.

There appears to be a lack of knowledge about the dental fiber, its canal and the so-called sheaths of Neuman. We speak of the dentine tubes, or of the dentine tubuli. A tube is any long and hollow cylinder—a pipe; tube or tubulus is certainly a misnomer. We should

speak of it as the dentinal canal or dentinal canaliculus, for a canal is a duct in a body for the passage of fluids, a duct through which anything may be conducted. If we examine the cross section of the developing tooth again, where only a narrow layer of dentine has been formed, we see on the edge of the fully calcified layer, between it and the formative cells, the transparent, hyalin layer already spoken of. It is somewhat irregular, as if it were formed by the merging of globular masses, a transitional tissue, *mind you*, which a further stage in the hardening process will completely calcify. It then becomes matrix or basis substance. It is formed by microscopic globules, calco-spherites, within the odontoblasts. These cells appear to superintend the laying of the globules which are arranged in the substance of the gelatinous tissue, a layer of which has been formed by the pulp to receive them: they are deposited against the fully-calcified matrix within the fibers of Mummery. This is the hyalin layer already spoken of. It is a layer of borderland tissue that is singularly indestructible in acids or in caustic alkalies. I have already stated that there appear to be two kinds of cells concerned in the formation of dentine: one, a fiber-forming cell, with a long process running into the canals; the other, a matrix-forming cell, the true odontoblast. This is usually square and abrupt against the dentine, and the process or processes which it appears to have, in many cases, I have found, belong to the fiber cells deeper within the pulp tissue. As the dentine layer forms, the fiber of the fiber cell lengthens, and against the surface or sides of this lengthening fiber the same hyalin layer is left uncalcified, as is found against the forming matrix next the formative pulp.

We frequently see two fiber cells merged into one, caused by the lessening circumference of the forming dentine; they have merged together, one losing its identity completely at that point, and so it is with the odontoblasts. It appears to me clear that all the branching of the canaliculi must be from the merging of these fiber cells, thus forming branches of the main fiber. The so-called sheath, then, is a transition tissue, probably the same as the tissue which remains uncalcified in the interglobular spaces in dentine. It is in no sense a separate tissue, and sheaths can only be demonstrated after full decalcification, when acids have completely destroyed the matrix. In cross section of the canals in dentine this borderland tissue can be stained by a preparation of nitrate of silver. It acts precisely the same as it does on the hyalin layer of forming dentine: it stains it black. Both tissues are matrix tissues in a partial state of calcification, and full calcification will take place in this borderland tissue against the fiber as age comes on, when the dentinal canals are found to be much smaller in diameter than they are in the young tooth. We may assume, then, that the so-called sheath of Neumann is but a transitional tissue only partially calcified, which may fully calcify in the future. It lines the canals in the dentinal matrix, and is only a sheath when acids have destroyed its adjoining more fully calcified substance.

In these various processes we have considered the calcification of the deciduous central incisor. The process begins about the fourth month, the crown is nearly formed at birth, and the tooth root fully formed at the eighteenth month. Thus far it has been my purpose to describe the various processes of dentinification taking place before and after birth, as demonstrated by research work. In describing these it has seemed necessary to repeat descriptions in order to make the subject matter clear. In concluding, a brief description of the

germ tissue remaining after full calcification has taken place, will be given. This germ tissue now becomes the normal pulp, which is the source of nutrition and nerve supply to the tooth. The main mass of this organ is made up of a semi-gelatinous matrix thickly studded with cells which do not in themselves form a continuous tissue, that is, they are not in contact with each other. They are imbedded in a jelly-like substance, in which many fine fibers are seen. In the center of the pulp tissue the cells are less numerous than they are near the formed dentine. The cells against the dentine are no longer square and abrupt against it. They are now oval or pear-shaped, with the pointed ends conveying a fiber to a canal in the calcified matrix.

The study of many sections of the pulp of fully formed teeth has led me to believe that the pear-shaped cells fringing the outer surface of the pulp, and having fibers running into the canals of the dentine matrix, are not cells having the same functions as did the formative cells, or odontoblasts, which were square and abrupt against dentine, while it was forming. There are indications that the pear-shaped fiber cells have a membrane, and they remain pear-shaped throughout the vitality of the pulp. When the pulp is irritated by the approach of caries, or from abrasion, or from some stimulation from without, the fiber cells do not appear to take part in the formation of secondary dentine, the dentine of repair; but new formative cells are seen to be developing from the cells of the so-called conjugation layer just within.

Weil has described an intermediary layer just within the odontoblastic layer, which consists of a large accumulation of spindle-shaped cells, somewhat different from the embryonic connective tissue cells of the main mass, which varies in breadth according to age. This intermediary layer represents the remains of what the Germans call the conjugation cell layer, a layer of reserve material, which seems to be a product of the growth changes of the pulp. I doubt if there is more than a remnant of it in adult teeth. Some authors assert that the cells in the center of the pulp degenerate, that the nucleus disappears, and that there is a partial loss of their protoplasm. This is undoubtedly the case in older pulps which no longer show the rich ramifications that the younger ones do. Lymphatic vessels have never been demonstrated with certainty in the pulp tissue. There is a network of undulating fibers which run from the root to the crown, parallel to the axis of the tooth. The interspaces between these cells and fibers being filled with a protoplasmic substance, their histologic nature has not been determined. It is stated that the cells of the pulp show characteristic differentiation at different times in its life. There are three kinds of cells which have their origin from the embryonic connective tissue cells by metamorphosis. These are round cells with large nucleus and scanty protoplasm; spindle-shaped cells; and irregularly shaped cells, which have branching processes that freely anastomose with the spindle-shaped cells and with themselves. The changes in the cells seem to begin at the periphery and proceed toward the center of the pulp. At the periphery we have the pear-shaped cells, then the spindle-shaped conjugation layer of cells, then the spindle-shaped and irregularly shaped cells with their anastomosing processes, and lastly, the connective tissue elements in the central portion of the pulp, which seem to be scant in protoplasm. These cells are not very numerous, and are in a jelly-like matrix. The blood vessels enter at the apex, the trunk vessels resting near the center of the pulp. Sometimes as many as three arteries are seen

to enter the apical foramen. They then divide into innumerable branches, and form an extensive network of capillaries near the layer of the pear-shaped cells next the formed dentine. There are numerous veins also found, and these are somewhat larger than the arteries. Black tells us that the blood vessels of the pulp are remarkable for the thinness of their walls, and that the smaller veins seem to be nothing more than endothelial cells which are placed edge on edge, or margin on margin. The arteries have a circular and longitudinal layer of muscular fibers, but these are very thinly distributed. The capillary network is so rich near the pear-shaped cells in the forming tooth that when they are injected and shown under the microscope there seems to be little room for any other tissue. The nerves of the pulp are many, the fibers being medullated and non-medullated, which enter the pulp through the apical foramen in bundles of various sizes. As they pass into the pulp they break into branches and form a rich network, a delicate plexus of fine nerve filaments next the outer pear-shaped cells. It is not known just how these communicate with the fibril. It has been asserted that the finer fibers may pass between the pear-shaped cells and wind themselves around the dentinal fibrils, passing thus into the canal. Sudduth inclines to the view that the terminal fibers unite with the pear-shaped fiber cells, and that sensation is thus transmitted by the dentinal fibril to the terminal branches of the nerves. In form a mature pulp is shaped nearly the same as the tooth to which it belongs.

## GANGRENE FOLLOWING THROMBOSIS OF THE ABDOMINAL AORTA AND ITS BRANCHES.

R. EDWARD GARRETT, M.D.

ASSISTANT PHYSICIAN, MARYLAND HOSPITAL FOR THE INSANE.  
CATONSVILLE, MD.

Rarely are there offered any better opportunities for observing arteriosclerosis in all its degrees and varieties than are found among the patients of the state hospitals for the insane. In many of these institutions it is a routine practice to note the condition of the arterial system of each patient.

It is now a well-established fact that arteriosclerosis is frequently hereditary and often congenital; indeed, it is not rare to find it markedly present in subjects (especially degenerates and imbeciles) as young as twelve years of age.

The following case is reported not only because of its unusual occurrence, but also on account of the absence of certain pathologic lesions which one would expect to find.

### HISTORY.

*The patient, Mrs. —*, aged 34, was admitted to the Maryland Hospital for the Insane April 25, 1900, suffering from melancholia agitata (puerperal in origin) which is now fast terminating in dementia.

*Etiology.*—Just previous to the outbreak of mental trouble, it is reported that she was prematurely delivered of a six months' child because of eclampsia, but an examination of the urine revealed only a trace of albumin, no casts could be demonstrated and no sugar was found—an ophthalmoscopic examination being rendered impossible by the restless condition of the patient.

*On admission* she was spare, but not emaciated, the heart and lungs were normal and the general physical condition somewhat below par. There is a moderate amount of arteriosclerosis; no history of lues. The mental condition has no bearing upon the subject under discussion, except that at times she is much agitated and restless, walking the floor at night and offering considerable resistance when bathed and dressed.

Between the time of admission and the date of the present illness there is nothing of interest to note.

*On March 5, 1902*, she became irritable and complained of pain in the legs with inability to stand or walk. She was put to bed, but as no redness or swelling was visible, and as the patient had previously been hypochondriacal, no importance was attached to the symptoms. Temperature 100 F. The following day the pulse became feeble and rapid (140 to 160) with profound syncope, quickly lapsing into a semicomatose condition, which continued for several hours, after which she gradually regained consciousness and the pulse became stronger and less rapid—pulse 100, temp. 100.8 F. A few days later a dry gangrene appeared in the small toe of the right foot, the remaining toes and foot following in quick succession. On examining into the circulation, the arteries on both sides from slightly above the bifurcation of the abdominal aorta to the popliteal (inclusive) were found to be obliterated. In the position of the femorals, hard, nonpulsating cords could be distinctly felt running down either thigh—which could be traced upwards under Poupart's ligament into the pelvis. The abdominal aorta could plainly be felt pulsating an inch below and to the left of the umbilicus, but could not be gotten below this point, the pulsation in the iliaes was likewise lost (while in another patient of similar adipose tissue and build, the arterial blood current in the iliaes could be distinctly felt).

*Amputation* was done through the right thigh at the junction of the upper and middle third, the Esmarch bandage was used, but was probably an unnecessary precaution, as the superficial femoral was clogged with a blood clot, the profunda, although patent at the point of incision, was probably occluded above; both of which were ligatured, however, together with a few of the smaller vessels. The operation was done as rapidly as possible, and there was no hemorrhage. The wound healed *per primam* with the exception of a small blood clot, which broke down and granulated.

The patient made a good recovery, but was purposely kept in bed longer than usual because of the doubtful condition of the left leg, which remained pale and cold, the difference in surface temperature being well marked between the thigh which, by collateral circulation, was not any too well nourished and the leg which was struggling for life.

*Present Condition.*—At the present writing, 37 days after the first symptoms, the foot and toes are still intact. Just which vessels are taking part in the collateral circulation can, of course, only be surmised—and just why it was established in one leg and not in the other cannot be explained.

*The dissection of the amputated part* shows the femoral and popliteal arteries to be occluded by a firm, hard thrombus, extending in one continuous clot from the point of incision in the femoral down through the popliteal to within about an inch of where the anterior tibial is given off. The veins were normal.

*Microscopically*, the sections show the clot within the lumen of the vessel to be in an advanced stage of organization, small vessels and some young fibrous tissue can be seen forming. The intima is normal, showing no proliferation of endothelium, the media shows the hyalin degeneration only very slightly and the adventitia is somewhat thickened. There is no evidence of any acute inflammatory trouble. This slight change in the media is somewhat inconsistent with the clinical condition found, and because of this lack of microscopic evidence to indicate that the clot was caused *per se* by the vascular lesion, it is thought that some unascertained coexisting exciting cause was responsible to a greater extent than usual.

### THE QUESTIONABLE ORIGIN.

The writer has been unable to decide to his own satisfaction whether the case is a traumatic one due to some unknown self-inflicted or accidental injury or whether it is one of those cases of so-called spontaneous coagulation due to certain febrile affections, such as is described by Pearce Gould of London, who reports cases following influenza.

It is possible that either of the above exciting causes could have been instrumental in producing thrombosis

in one already predi-posed by even as moderate an amount of arteriosclerosis as the one in question.

My thanks are due to the Superintendent, Dr. J. Percy Wade, for the privilege of reporting the case.

### Clinical Report.

#### MATERNAL IMPRESSION "MARKS" CHILD FOR A FROG.

J. W. COOLIDGE, M.D.

BRISTOL, N. H.

Mrs. R., aged 31, of good intellectual ability, and not superstitious, gave birth, March 13, 1902, to a stillborn, seven months' male child.

Fetal movements were noticeable the previous evening and death seemed to have been due to a long second stage, it being  $3\frac{1}{2}$  hours in length.

The child having no neck, the head was almost immovable on the shoulders, so much so that it was a left brow presentation,

The gross appearance of the child's back is that of the back of an injured frog when he elevates the flat surface extending backward from the head.

[The case described above is a form of monster belonging to the group of exencephalus. The deformities in these monsters, as well as in the anencephali and in the cases of spina bifida, is started by a failure of the posterior vertebral plates to close over the neural canal in early embryonic development. This deformity, cranio-rachischisis, may be due to an excessive formation of cerebrospinal fluid or to some thing that interferes with the union of the posterior lamina, e. g., adhesions of amnion to the edges of the medullary groove.

The belief that an idea of the mother during pregnancy can have any influence on the causation of such a deformity has no support from any scientific observation and is almost incredible. The mother has no connection with the child in utero except through the blood supply. There is no nervous connection, and even if there were it is difficult to imagine how the amniotic adhesions could be produced by an idea or mental condition of the mother.

This matter is of considerable importance because of the widespread belief in the efficacy of maternal impressions in

the left shoulder following immediately, and so rigid were these parts that the maternal coccyx was strained backward sufficiently to cause extreme pain for a few days.

The child's eyes protrude far beyond the brows, and there appears to be no brain cavity, except two little sacs on the back of the head, with a smaller one between and posterior (cerebellum).

There are two parallel lines of bony prominences extending from the back of the head downward as far as the last dorsal vertebra, separated by a space a little more than an inch wide, over which there is no skin, leaving the flesh like a fresh wound. The bony prominences are bordered by a thin osseous scale, and this for the upper two thirds by a narrow line of fine hair. The body and extremities are otherwise normal.

Mrs. R. has one child four years old and has had one abortion. She is not easily frightened, and at first could remember nothing to account for the deformities. Later she remembered carrying out a frog the cat had killed and brought into the house at about the third month of her pregnancy.

producing deformities and "mother marks." This belief among mothers leads to much useless and harmful anxiety during pregnancy, for all women are liable to see unusual sights that may frighten or disgust them. Moreover, if a deformed child is born the mother is very apt to blame herself or some other innocent party for the assumed causation of the trouble. A physician, therefore, instead of searching out some forgotten incident that by the exercise of a lively imagination can be made responsible for the deformity, should rather seek to educate his patients to remove their fears and superstitions.—EDITOR JOURNAL A. M. A.]

**Uniform Preparation of the Cinchona Alkaloids.**—Myttenaere, of Hal, Belgium, states that the methods of preparing cinchona bark according to the various pharmacopœias causes a difference of 2.2 to 6.8 per cent. of the alkaloid in the resulting extracts. He states that this variation can be prevented and the identical results always attained, if ammonia be used instead of fixed alkalis for extracting the alkaloid, and pure chloroform instead of the various mixtures proposed.—*Gaz. Méd. Belge*.

Subscription price: Five dollars per annum in advance

SATURDAY, JUNE 21, 1902.

## SARATOGA MEETING.

The Saratoga meeting of the American Medical Association, while not showing as large a registration as that of the preceding two or three years, was in every way a success. The Section work was especially good in every Section, and all were well attended. Nearly every year there is some Section that "falls down," but in this regard the Saratoga meeting proved an exception. The high standard of the papers read, and the scientific and practical nature of the discussions, were noticed by every one. The Section officers deserve the highest praise for the work they accomplished and congratulations on the result of this work. The fact that there were no general meetings to interfere with the morning meetings of the Sections gave much more time to the scientific work of the Sections, which proved very satisfactory.

The House of Delegates proved to be a truly representative body, only two states being without representation, and its *morale* showed that it stood for the best and the scientific in the American medical profession. It accomplished a very large amount of work and in a most satisfactory manner, in spite of the fact that its rules, plan of work, etc., all had to be formulated at this session. With a system, rules of order, etc., finally adopted, it will be able hereafter, with the aid of a few committees, to be more deliberate than was the case at the first session. It was evident to all that the House of Delegates is a great improvement on the old general meetings.

Saratoga proved a most satisfactory place of meeting. There was no crowding, the hotel accommodations being ample. A serious fire of Monday night disarranged places of meeting for the Sections, but only to a slight degree. The profession and citizens of Saratoga did remarkably well, and received well-deserved thanks for their painstaking efforts to make the meeting a success from the social side.

## THE NEW PRESIDENT OF THE ASSOCIATION.

The election of Dr. Frank Billings as President of the Association for the ensuing year meets with general favor on all sides. A more generally satisfactory choice could hardly have been made. In the first place, all who know something of the personality of the new President find in him a fortunate blending of qualities that go to make successful leaders in professional and educational affairs. Energetic, forceful, judicious, and

withal sympathetic—these are some of the more prominent general characteristics that have placed Dr. Billings in such high esteem in the community and in the American medical profession. Not yet fifty years of age, his professional career began as interne in the Cook County Hospital after graduation from the Chicago Medical College (now the Northwestern University Medical School) a little over twenty years ago. This was followed by a period of arduous study in Vienna, where his industry and comprehensive grasp of clinical problems soon attracted the special attention of his teachers, all of whom followed his subsequent development into a leading practitioner and teacher with personal interest. Returning to Chicago he became identified with his *alma mater*, and, passing rapidly through

FRANK BILLINGS.

subsidiary positions, soon gained the professorship of medicine and leading official posts in that institution. When the reorganization of Rush Medical College was commenced some five or six years ago, Dr. Billings was made the head of the Medical Department and Dean of the Faculty, and as such he has taken a leading part in the new development of this school. For years he has been a leading practitioner in internal medicine in the Northwest, whose advice and skill as a diagnostician have been and are widely sought. Needless to say he has always been prominent in all endeavors toward raising the standards of medical education and the better organization of the medical profession, taking an active and prominent place in local, state and national societies. From time to time he has made valuable con-

tributions to medical literature, among the more recent being clinical studies in cirrhosis of the liver, the address in Boston before the Massachusetts Medical Society on the spinal cord lesions of pernicious anemia, and the address in medicine at the Saratoga meeting. As a teacher he is valued especially for his clearness, thoroughness and the application of modern methods in clinical medicine, encouraging investigation and research on part of assistants and students. Finally, mention should be made of his exemplary conduct as a citizen of a young metropolis in devoting much time and energy to the improvement in the management and to the upbuilding of its medical and scientific institutions. These are some of the principal achievements of the vigorous and progressive man, animated throughout by high principles, to whom the distinguished office to which he has just been elected truly may be said to come as a well-merited honor.

#### A SUGGESTION FOR SURGEONS AND OPERATORS.

The operating surgeon should study pathology. The rapid strides of surgery in the last few decades are to be attributed largely to refinements of technic and diagnosis, the elimination of infection and improvements in the mechanical aids to operating. A certain degree of familiarity with the gross appearances of pathologic conditions, as well as a better understanding of regional anatomy, are no doubt gradually acquired in the operating room; a deftness, sometimes mistaken for skill, and the possession of an analytical mind that enables more exact diagnoses to be made are also desirable—attributes that, however, are not always met in the same individual. But these qualifications, valuable though they are, should not be striven for to the exclusion of a knowledge of pathologic anatomy, and this to be useful can only be obtained by painstaking study and labor.

Nevertheless, it cannot be denied that, generally speaking, the local surgeons of the smaller hospitals that are so universally springing up in places of a few thousand inhabitants, like their more noted confrères of the cities, of whom naturally more is expected, are satisfied with such details of pathologic anatomy as can be obtained in the living body. The specimen is examined or the necropsy made by a pathologist and the surgeon receives a report; with the operation brought to a successful termination, his interest too commonly is wholly transferred to the patient; the cause of the malady and its *modus operandi* receive scant attention at his hands. Few surgeons take time to dissect and study diseased tissue or tumors that they remove, in short, to store up in their memories more exact impressions of pathologic anatomy than those acquired in hurried operations. Some few, it is true, are interested in promoting such studies by those less occupied than themselves and who aim at surgery as a vocation, but their number is small when compared with the many whose interests are still firmly absorbed by details of operative technic and post-operative therapy.

It is a well-known fact that surgeons are seldom seen at the autopsies of their own patients, and anything more than their occasional presence at the meetings of pathologic societies has long since ceased to be expected. There are few fields that offer greater opportunities for development, especially in this country, where, as before stated, the progress in surgery has been in other directions. A striking contrast is afforded by the close touch maintained by the physician with morbid anatomy. Not only is he usually the strongest factor in securing privileges of postmortem examination, but many of his problems for investigation come from the material and data obtained in this manner. His greater development is shown by the desire that the examination be complete and thorough, whereas the surgeon often specifies that the entire examination must be made through a laparotomy incision.

It has been, therefore, an entirely natural occurrence to have from various sources such expressions as we noticed recently<sup>1</sup> relative to the too frequent recourse to operative procedures in general surgery and the surgical specialties. There is an echo to some of the statements referred to of Reginald H. Fitz of Boston, in those of Ewing who, in a timely article, attempts to estimate the malignancy of carcinoma of the mammary gland by combining the appertaining clinical and pathologic data.

The extremes and various degrees of malignancy manifested by tumors and thoroughly appreciated by the pathologist are almost unknown to the average surgeon. Ewing points out in a forcible manner that the various forms of mammary carcinoma demand recognition by the surgeon when tables of cured cases are compiled, especially when carcinoma accidentally discovered in breasts removed for benign processes and inflammation are included with the permanently cured. The value to be derived by the surgeon from a perusal of Ewing's article must of necessity be small; he may be interested in knowing that papillary growths of cysts of the mammary gland and other forms of adeno-carcinoma demand a consideration definitely separated from that given to true carcinoma; but these names can carry to his mind no ideas of practical utility unless they are associated with distinct recollections of the associated pathologic anatomy.

The temptation spontaneously arises to suggest more thorough coöperation between pathologist and surgeon as a remedy for the evils that have been hinted at; but this, it is at once apparent, could but counteract wrongs that already exist. The real corrective that is indicated is for the surgeon to ascertain for himself the facts that are being brought to his notice alike by pathologists and physicians. By such means he may forestall the outcry against too prevalent operating; close familiarity with pathologic anatomy will not only teach accurate diagnosis, but, better than all else, it furnishes the knowledge for correct prognosis, and it is the danger and futility of certain operations that are being called to the attention of operators.

1. THE JOURNAL A. M. A., April 26, 1902, p. 1082.

## MYELOGRAPHY.

Nerve suture is a recognized surgical procedure, though it is not so very long since it wore off its novelty, so that its literature ceased to grow with every successful repetition of the operation. It is a long step, however, though perhaps not an unanticipated one, from nerve suture to suture of the spinal cord itself. We know that nerve fibers regenerate in the peripheral portion of a severed nerve, but this does not prove that they would effectively do so in the more complicated nerve center, though the course of certain surgical lesions suggests the possibility. Experimental results on animals have, however, pointed to the probability of such occurrence. In the *Philadelphia Medical Journal* of June 7, Drs. F. T. Stewart and R. H. Harte report a case that is especially noteworthy as demonstrating this fact under conditions as convincing as those of the best conducted experiment. The patient, a waitress, had been shot twice with a 32-caliber revolver, one ball entering about one inch to the right of the seventh dorsal spine and passing directly into the spinal canal. There was immediate and complete abolition of motion and sensation below a line transecting the lower part of the tenth dorsal spine and a point three and one-quarter inches above the umbilicus. The line of demarcation was sharply defined and was superimposed by a belt of hyperesthesia reaching as high as the ensiform cartilage, but this also became anesthetic just before the operation. The superficial and deep reflexes could not be elicited. The temperature was subnormal, 97.6; the pulse 120 and fair, and the mind clear. Three hours after the accident operation was performed. An incision about five inches long was made over the dorsal spines with the eighth dorsal spine for its center. After dissecting back the muscles on either side the right lamina of the seventh dorsal vertebra was found crushed in and left lamina of the same vertebra fractured at its base. The spine and lamina of the seventh and eighth dorsal vertebra were removed and the rent in the membranes, through which could be seen the leaden bullet and a number of small fragments of bone lying between the ends of the severed spinal cord, exposed. The spinal cord was entirely severed and after removing the bullet and the lacerated nerve tissue, the distance between the segments of the cord was three-quarters of an inch. This observation was verified by the assistants. The wound was flushed with salt solution and the ends of the cord approximated with three chromicized catgut sutures passed by means of a small staphylorrhaphy needle, one suture being passed antero-posteriorly through the entire thickness of the cord and the other two transversely. The procedure was difficult on account of the narrow space, the consistency of the cord and the wide interval between the fragments, the catgut frequently tearing out before the ends were finally brought together. The dura could not be approximated. A small gauze drain carried down to the cord was allowed to remain for twenty-four hours. The muscles were united with deep sutures of catgut

and the skin closed with silkworm gut. The patient was in a better condition after than before the operation.

Sensation began to appear in the form of pain on pressure or squeezing as early as the fifth day and passive movements were felt on the fourteenth day. On the twenty-first day bladder sensation returned and the patellar reflex was detected for the first time. At the end of two months the patient was out of bed in a wheeled chair, could move the right big toe and feebly flex the knee. The progress was steady after this. Visceral function returned and now, sixteen months after operation, the patient can voluntarily flex and extend the limbs and rotate the thighs and is able to stand with either hand on the back of the chair, thus supporting much of the weight of the body. The sensations of touch, temperature, pain and position are general. The difference between heat and cold is not quite fully felt. Pinpricks can be localized as low as a line running two and one-half inches below the umbilicus. A single pinprick can be differentiated from several and from a sharp blow of the pencil as far as the knee, but localization is not accurate. Reflexes have reappeared to a large extent and are reinforced by muscular exertion of the face or arms. Trophic changes and degeneration reactions are absent. Bladder and bowel control have been regained to a large extent since the eighth month. As Stewart and Harte remark, this seems to be the first clinical myelorrhaphy performed on man, and as such it will stand as a landmark in spinal surgery. The fact that it was a practical resection of the cord and approximation of the divided ends adds to its interest. The partial return of function under the conditions existing suggests the possibility of a still better result in cases where such tension and tearing and mangling of the spinal tissue could be avoided. The authors have succeeded in approximating the cut ends after resection of an inch of the cord in the cadaver; that they were thus successful under the much less favorable conditions with a separation of three-fourths of an inch in the patient, indicates the tolerance of the parts as well as the skill and boldness of the operators.

The operation will doubtless be repeated from time to time; it is one that seems certainly justifiable, and even better results may be hoped for in some future cases. It is only another step to spinal grafting, even if the lower animal tissues cannot be utilized. This is certainly not beyond the legitimate possibilities of the scientific imagination. As it stands, the case is one of the most notable in the surgery of the nerve centers.

## HYPODERMIC PARAFFIN INJECTIONS.

Since hypodermic and submucous injections of paraffin were first introduced by Gersuny in 1900, the method has been applied to a variety of conditions with most gratifying results. Solid and liquid paraffins are mixed in such proportions that the mixture has a melting point of from 96.8 to 104 F. This is sterilized by boiling, drawn into a sterilized syringe while liquid and in-

jected after cooling partially, the material passing from the needle as a semi-solid thread. If paraffins of a lower melting point are used they do not become firm enough, and if those which require a higher temperature to melt are employed, the heat needed to keep the paraffin soft enough to allow it to be injected may do harm. Sterile paraffin is devoid of any toxic properties and when injected hypodermically produces no reaction. In places where the paraffin is not subjected to pressure, it remains where injected, and finally becomes encapsulated and of the hardness of cartilage. The mass becomes surrounded by a connective tissue capsule, but it is probably never absorbed. Schleich's infiltration anesthesia may be employed if the injection is made into tissues which do not readily yield.

Injections of paraffin have been used largely for the correction of defects and for cosmetic purposes. Successful treatment of nasal deformities, especially depression of the bridge, has been reported by various operators. Depressions of the surface after resection of the superior maxilla, resection of ribs, etc., have been overcome by these injections. The difference in the appearance of the two sides of the face in progressive facial hemiatrophy has been corrected by the injection of paraffin beneath the skin. Excised testicles may be replaced by ones of paraffin which do not differ in external appearance from the natural organs. Most gratifying results have followed the use of the injections for the relief of incontinence of urine due to injuries of the urethra and vagina, and for incontinence of feces from fistula in ano, etc. It has been recommended for narrowing the inguinal ring in hernia, and for the prevention of vaginal prolapse. After enucleation of the eyeball, it has been employed to improve the shape of the stump with evident success. The field of usefulness for this method of treatment appears to be large, and new opportunities will constantly occur in which it may be applied. With a certain amount of artistic talent, most remarkable cosmetic effects may be expected from its use.

#### NEW JOURNAL.

*American Gynecology* is the title of a new journal which is announced to begin publication from New York City in July, and which will be devoted to gynecology, abdominal surgery and obstetrics. The journal will be owned and controlled by a stock company consisting solely of members of the profession interested in its special field. It will be conducted under the able editorial management of J. Wesley Boyée, M.D., Washington, D. C.; Charles Jewett, M.D., New York; Charles P. Noble, M.D., Philadelphia; Reuben Peterson, M.D., Ann Arbor, Mich., and J. Whitridge Williams, M.D., Baltimore.

#### SURGEON-GENERAL FORWOOD.

The new Surgeon-General of the Army, Brigadier-General William H. Forwood, has had a long and honorable record in the service. Entering the army in 1861 as an assistant-surgeon, he was present at many engage-

ments up to October, 1863, when he was severely wounded. During the remainder of the civil war his duty was chiefly in charge of hospitals and depots, but later he was again in active service on the frontier in Indian campaigns in the 60's. He has held many important positions in the medical department of the army since the civil war, such as president of the army medical school, and of the army medical examining board and other boards, head of the medical service in army departments, etc. Besides his medical writings, which are numerous and include monographic articles on military surgery in systematic treatises and text-books, he is the author of a number of scientific papers, botanical,

WILLIAM H. FORWOOD.

geological, etc., in government publications and elsewhere. His retirement under the age limit will occur next September.

#### LATENT PNEUMONIA.

Now and again death takes place abruptly, without premonition, or possibly after some trivial cause not sufficient in itself to bring about the fatal event. If such an occurrence be sequent to injuries received at the hands of another, or alleged thus to have been inflicted, it may become a matter of medicolegal importance to determine the exact part played by all of the possible etiologic factors. Under such circumstances postmortem examination may at times disclose some wholly unsuspected morbid condition as the cause for the sudden taking off. The most common cause for such an event is disease of the heart, particularly involving the aortic leaflets and orifice, while among the acute inflammatory disorders that may pursue a latent course throughout the entire period of their existence pneumonia is one of the most common, if not the most com-

mon. As the result of an analysis of 33 cases of the latter kind in which death took place suddenly and unexpectedly, the patient exhibiting no obvious sign of disease, Mr. Harvey Littlejohn<sup>1</sup> affirms that pneumonia may be completely latent during its whole course. The form of the disease most liable to be latent is basal lobar pneumonia. On the other hand, alcoholic apical pneumonia is rarely latent during its whole course. The disease may be latent even though the whole of one lung or a considerable portion of both lungs is affected. In cases of latent pneumonia, sudden death most commonly occurs during the stage of gray hepatization. The condition is practically confined to individuals addicted to excessive alcoholic intemperance. Complete consolidation of the whole of one lung is not inconsistent with a person having continued to lead an active life up till the time of death. Latent pneumonia is most frequent as a cause of sudden death during the winter months. It is most common after the age of 40 years and in the male sex. The explanation of the latency is to be found in the quantity of alcohol consumed after the onset of the disease, first, in masking the ordinary signs and symptoms by dulling sensibility; second, by its stimulating effect, thus enabling the person to go about until he suddenly collapses and dies. In medicolegal cases the discovery of latent pneumonia may satisfactorily explain the death of an individual and thus allay suspicion connected with the case. On the other hand, the existence of pneumonia, even in an advanced stage, will not preclude the possibility of an individual having died from other causes, natural or violent, and of his having been at the time of receiving an injury in a state of apparent good health.

#### THE PATHOLOGIC EXHIBIT AT SARATOGA.

While not so large as the exhibit at St. Paul a year ago, the exhibit at Saratoga with its well-arranged specimens, 1300 or more in number, proved fully up to the standard of former exhibits as regards quality and general educational value. Dr. Jeffries and his co-workers deserve hearty thanks for their successful efforts, which meant to these gentlemen and others much hard, and at times not very interesting work. The exhibit was visited by large numbers, the well-lighted hall being crowded much of the time. The unrestrained admission of the laity, including minors, was probably not altogether desirable from various points of view and ought to be better controlled at future meetings. The proposed enlargement of the scope of the exhibit, which was urged in the address of the chairman of the Section on Pathology and Physiology, will surely meet with general approval. It is the intention hereafter not to limit the exhibit so much as heretofore to pathologic anatomy, but to make a "scientific exhibit," including suitable materials of anatomic, physiologic, pathologic and bacteriologic interest, not intending thereby, however, to open the doors, even the slightest, for commercial concerns, such as instrument makers and others. The suggestion to appoint a director of the exhibit and to pay him something for his work is also calculated to still further improve and develop the undertaking in the right direction. Among the individual exhibits it may be permissible to refer

especially to the large, interesting, and well-mounted collection of pathologic specimens from Rush Medical College. The idea exemplified in the arrangement and labeling of the specimens in this group seemed to be to make everything so clear that "he who runs may read." And this feature was certainly worthy of emulation. This group contained an instructive series of specimens illustrating adrenal tumors (hypernephromas) of the kidney and elsewhere, and their metastases into various parts, including the bones. In view of the frequency and clinical importance of this form of tumor, these specimens were shown at a most opportune time, because of the need now of popularizing what has been learned during recent years of hypernephromas. Reference may be made also to a specimen of a white rat that by some misfortune early in life lost one hind extremity and part of its tail, the stump of which had been adapted to do the service of the absent member—an excellent illustration of adaptation under unusual circumstances. The collections of appendices vermiciformes by Dr. Emerson and by Dr. Abbe were artistic and instructive. Among other collections may be mentioned those from the Post-Graduate School of New York, from the University of New York, from the Albany Medical College—an interesting group of bone specimens from the Western Reserve Medical School, and the anatomic specimens from the Medical Department of the University of Illinois. It will be noticed that the institutional exhibits were limited to a rather small number of institutions, so that there remain rich sources for future meetings. Among individual exhibits that by Ravenel of Philadelphia, illustrating the development of bovine tuberculosis from the injection of the bacillus of human tuberculosis and its products was especially noteworthy because of its bearing upon the question of the dangers of bovine tuberculosis. Close examination of the specimens could only strengthen the position of Ravenel and others in their attack on Koch's views. The models of smallpox lesions shown by Dr. Ewing; Dr. Newborn's cultures of fungi causing hair diseases; and Dr. Rosenow's cultures of the tubercle bacillus also merit mention. The x-ray pictures of the intestinal movements from the Harvard Physiological Laboratory were among the more remarkable of the large series of photographs placed on exhibition by various persons. Even this very incomplete list will indicate the scope and educational value of the exhibit, the influence of which, if continued and enlarged, in the final instance can not but lead to an increased general interest in the scientific aspects of medicine.

---

**Study of the Autointoxications of Pregnancy.**—A recent Geneva thesis by J. Olivier reports the results of the investigation of the eliminating power of pregnant women by means of methylene blue or rosanilin. The elimination was found normal in many cases which presented the severest symptoms clinically. In other cases, the elimination was notably defective while the course of the pregnancy and puerperium was normal. In five cases of eclampsia, the elimination was defective in all but one. In this patient the elimination was perfectly regular, but the symptoms were far more severe in this case, and it terminated fatally. Olivier concludes that renal or hepatic insufficiency is not inevitably necessary to the production of autointoxication. The pathogenesis in certain cases evidently includes an overproduction of toxins. The elimination of such excessive amounts is impossible in spite of the integrity of the natural emunctories.

1. Edinburgh Medical Journal, April, 1902, p. 317.

## Medical News.

### IDAHO.

**Addition to Hospital.**—An addition to St. Alphonsus Hospital, Boise, is under construction. It will be of brick, two stories high, 42 to 100 feet, will contain 23 rooms for patients, operating and dressing rooms, etc., and will cost about \$25,000.

**Quack Doctor Convicted.**—F. W. Martin, who has been professing to cure cancer and other diseases, agreed to cure a cancer for a woman in Shelley, and had taken her husband's notes for \$175 and \$25 in cash, but never did anything beyond sending her a box of salve and some powders. He was arrested and tried for practicing medicine without a license, pleaded guilty, and in default of money to pay his fine is now working out his sentence in the Bingham county jail.

### ILLINOIS.

**Macomb Hospital.**—Under Roman Catholic auspices a modern hospital to accommodate from 40 to 60 patients is to be erected at Macomb, at a cost of \$25,000.

**Robbins Resigns.**—Dr. Joseph Robbins, superintendent of the Illinois Central Hospital for the Insane, Jacksonville, has resigned on account of lack of harmony among the attaches. The resignation takes effect July 1.

**The Wabash Hospital.**—The Wabash Railroad Company will pay \$7500 for the site of its division hospital at Decatur, and per contra, the city agrees to furnish water to the hospital at four cents a thousand gallons until \$7500 worth has been used.

**State Board Loses Suit.**—Attorneys for the State Board of Health lost their case against Mrs. Mabel A. Jackman, who was charged with practicing medicine without a license. On February 13 Mrs. Jackman was fined \$100 by Justice O'Donoghue. The case was appealed and Judge Kavanagh reversed the decision. Mrs. Jackman claims to be a spiritual healer, and says she has never offered medicine in healing.

### Chicago.

**Underdosage of Patients.**—The medical officer-of-the-day, after an interval of rest, comes to the front with the statement that nurses are not giving patients at the County Hospital as much medicine as the physicians direct.

**Personal.**—Dr. and Mrs. Arthur R. Elliott have sailed for Europe.—Dr. Arthur M. Corwin has been appointed professor of diseases of the nose, throat and ear, in the Chicago Clinical School.—Dr. Albert B. Hale will spend the summer in Germany, returning about September 15.

**Improved Public Health Conditions.**—The Department of Health reports that public health conditions continue to improve, as is to be expected at this season of the year. Next to November, the month of June has had the lowest mortality rates of any of the months during the last twenty years. Last week's total deaths were 461.

**Unlicensed Hospital Burned.**—On June 9 a building occupied as a hospital for inebriates and operated by an ex-hermia curer of Denver, who now poses as a philanthropist, caught fire, and ten lives were lost, the list including two physicians. The Health Department had repeatedly been asked to issue a hospital permit for this institution and had, after repeated inspections, invariably declined.

### INDIANA.

**Morbidity.**—Diseases prevailed in the following order in May: Rheumatism, tonsillitis, bronchitis, pneumonia, measles, diarrhea, pleuritis, influenza, erysipelas, scarlet fever, whooping cough, typhoid fever, cholera morbus, diphtheria, dysentery, puerperal fever, cerebro-spinal meningitis.

**Preventable Mortality.**—In the annual report of the State Board of Health it is shown that 9377 deaths occurred from preventable diseases. Consumption caused 4662 deaths; typhoid fever, 1198; scarlet fever, 149; diphtheria, 554; diarrheal diseases, 2501; puerperal fever, 292, and smallpox, 21.

**Hospital for the Incurable.**—In response to the offer of an anonymous individual who offered to give \$5000 toward the building of a hospital for incurables at Indianapolis, provided a like amount was subscribed, the Flower Mission has received subscriptions amounting to \$5016. It is proposed to erect the building on the City Hospital grounds.

**May Deaths.**—The statistics of the State Board of Health for May show that there were 2502 deaths in that month for the state—a rate of 11.7 per 1000 per annum. The city deaths

numbered 1065, a rate of 14.6 per 1000 per annum, and the country deaths 1437, a rate of 10.2 per 1000 per annum. The city rate is 2.9 higher than the rate for the whole state and the country rate is .5 lower than the rate for the whole state. By important ages the deaths were: Under 1 year of age, 353; from 1 to 5, 126; from 5 to 10, 60; from 10 to 15, 47; 65 and over 658. Twenty-eight per cent. of the deaths were of those over 65. By important causes, the deaths were: Consumption, 344; pneumonia, 192; typhoid fever, 32; diphtheria, 26; measles, 19; whooping cough, 14; scarlet fever, 5; diarrheal diseases, 30; cerebro-spinal meningitis, 21; influenza, 14; puerperal fever, 16; cancer, 104, and violence, 140.

### MARYLAND.

**Midwife Fined.**—A midwife of Baltimore was fined \$20 and costs, last week, for treating a new-born infant suffering with purulent conjunctivitis contrary to law, which requires such cases to be reported at once to the health commissioner or turned over to a physician.

**Personal.**—Dr. Smith H. McKim of the Hospital for Crippled Children, Baltimore, who spent several months in orthopedic work in England, France and Germany, has returned to the city.—Among the passengers sailing from Baltimore, June 10, for Bremen were Drs. Louise Erich and Albert Haas.—Dr. Harry Baetjer has sailed for Europe, where he will investigate the x-ray apparatus at the leading universities in the interest of the Johns Hopkins University. Dr. Thomas R. Barber, of Granite, Baltimore County, was run over on June 12 and had his leg broken.

**Faculty Changes in University of Maryland.**—The vacancy in the chair of surgery in the University of Maryland, created by the resignation of Dr. L. Melane Tiffany, has been filled by the election of Dr. Randolph Winslow, who has for several years filled the chair of anatomy and clinical surgery and prior to that was professor of surgery in the Woman's Medical College. Dr. J. Holmes Smith, demonstrator of anatomy, has been advanced to the chair of anatomy in the same institution. Dr. D. M. R. Culbreth has been made professor of materia medica and Drs. Frank Martin and St. Clair Spruill have been made clinical professors of surgery. Dr. Joseph W. Holland has been made demonstrator of anatomy.

**Johns Hopkins Commencement.**—The commencement of the Johns Hopkins University was held on June 11. Among the graduates were 57 in medicine, of whom 5 were women. President Remsen announced that \$908,000 of the \$1,000,000 endowment fund had been collected and announced himself confident that the balance would be raised by July 1. The following are the "honor men" of the medical class: Henry William Ochsner of Waumandee, Wis., S.B. Univ. of Wisconsin, 1898, first honor, followed in order by Thomas W. Clarke, M.D., Utica, N. Y.; John Auer, M.D., Chicago; John B. Briggs, M.D., Baltimore; Carl H. Horst, M.D., Butte, Mont.; Alice W. Tallant, M.D., Boston; John W. Churchman, M.D., Burlington, N. J.; Camillus Bush, M.D., Woodland, Cal.; Carey P. Rogers, M.D., Raleigh, N. C.; Otis B. Wight, M.D., Stanford Univ., California; Nellis B. Foster, M.D., Utica, N. Y.; Edmund W. Meisenholder, M.D., York, Pa.; Charles B. Wright, M.D., Grand Forks, N. D., and Henry W. Cook, M.D., of Baltimore. The following appointments in the medical faculty were announced: William G. MacCallum, M.D., now associate, to be associate professor of pathology; Guy L. Hunner, M.D., now instructor, to be associate in gynecology; Walter Baumgarten, M.D., to be assistant in medicine; Florence R. Sabin, M.D., to be assistant in anatomy, and Benjamin R. Schenck, M.D., to be instructor in gynecology.

### OHIO.

**Personal.**—Dr. Edwin S. Ricketts has been elected to the chair of abdominal and gynecological surgery in the Cincinnati College of Medicine and Surgery.

**Western Reserve Commencement.**—Western Reserve University held its seventy-sixth annual commencement and the fifty-eighth annual commencement of its medical department at Cleveland, June 12. A class of 36 was graduated in medicine.

**Surgeons of the Fourth.**—The new medical staff for the Fourth Regiment is as follows: Dr. J. Wilson McMurray, Marion, surgeon-major; Dr. Sterling B. Taylor, Columbus, assistant surgeon, and Dr. Cassius M. Shepard, Columbus, assistant surgeon.

**Faculty Changes.**—The Medical College of Ohio, the medical department of the University of Cincinnati, announces the following additions to the faculty for the session of 1902-3: Dr. Charles A. L. Reed has been appointed professor of clinical gynecology; Dr. A. H. Freiberg, professor of orthopedic sur-

gery; Dr. Charles Seth Evans, professor of genito-urinary surgery; Dr. J. W. Rowe, adjunct professor of obstetrics, and Dr. Robert Caruthers, adjunct professor of surgery.

## PENNSYLVANIA.

### Philadelphia.

**Reception for Surgeon-General of Navy.**—The Medical Club gave a reception and banquet in honor of Surgeon-General Pressley M. Rixey, U. S. Navy.

**Gift to University.**—An anonymous gift of \$100,000 has been recently made to the University of Pennsylvania, to be applied to the building fund of the new medical laboratories.

**Personal.**—Dr. William Thompson has resigned as attending surgeon to Wills Eye Hospital and is succeeded by Dr. William Campbell Posey.—Dr. Sarah H. Lockrey has been elected to the staff of visiting physicians of the West Philadelphia Hospital for Women, vice Dr. Ida E. Richardson, deceased.

**Hospital Bequests.**—The late F. G. Dreer left by will about \$100,000, to be divided, after ten years, among the Frederick Douglas Hospital, Presbyterian Hospital, German Hospital, and other charitable institutions. Should his sons die without children over \$200,000 is to be divided among a large number of hospitals, homes, etc.—The late Dr. Hulshizer left a large part of his library to St. Joseph's Hospital with an additional bequest of \$500 on the death of his widow.

**Municipal Hospital Inadequate.**—The present Municipal Hospital, which treats contagious diseases, exclusively, is inadequate in capacity and equipment for the purpose. Money has been appropriated for a new hospital, but great difficulty is experienced in selecting a suitable site, especially because the residents and property-holders near all proposed sites make such strenuous objections to the pest-house. Dr. John V. Shoemaker, president of the Board of Charities, proposes, as a plan in solution of the problem, to place the Municipal Hospital in connection with the Philadelphia Hospital (Blockley), the former replacing the insane department and almshouse now connected with the latter. In such an event, the insane department and almshouse would be removed to some isolated, ample place, perhaps Petty's Island.

## GENERAL.

**Quarantine Island at Honolulu.**—Kuahua Island in Pearl Harbor, near Honolulu, is to be transferred to the United States for use of troops who are quarantined, to avoid the unpleasant necessity of keeping soldiers and officers restricted to crowded quarters on shipboard in sight of land, in cases of ships with contagious disease aboard. This provision for comfortable quarters for several thousand men is especially valuable now in view of the cholera and plague in the Asiatic ports from which our transports come.

**San Francisco Plague Report.**—*Fifty-fifth Case:* Lee Mon, aged 42, Chinese printer, died at 731 Washington Street at 1 p. m. on May 19, 1902. Autopsied at 3:30 p. m. Body that of an unusually well-nourished, muscular Chinese male. Rigor mortis just beginning. Pupils moderately dilated. Sclera showed great injection of blood vessels and a few small hemorrhages. No evidence that "black sun" treatment was given patient during life. Two or three small hemorrhages into the skin over the abdomen. Right inguinal region more prominent than left, and over this area of prominence the skin had a yellowish anemic appearance, probably due to pressure from the edema beneath. This yellowish area extended along Poupart's ligament, from the pubes to the anterior-superior spine, a line from the anterior-superior spine dropped downward for three inches, thence across to the center of Scarpa's triangle to a point about three inches below Poupart's ligament and thence back to the pubes. Palpation in this region showed a mass of enlarged glands so matted together by infiltration that it was impossible to feel any individual gland but only the whole indurated mass, which constituted an important plague indication. Incision, crucial in shape, was made over this area. Flow of edematous fluid followed the knife-cut. Subcutaneous tissue found injected and edematous. The glands were enlarged, hemorrhagic with areas of necrosis. Incision made on the opposite side showed normal inguino-femoral region. There was no wound to account for the glandular enlargement mentioned, nor lesion of the penis, and by far the greater—five-sixths—of this glandular mass lay below Poupart's ligament. Two old atrophic scars, one on the right leg, two inches above the ankle, lying over the anterior aspect of the tibia. These scars were probably the result of injuries received many years ago. There was no enlargement of the axillary glands noticed on palpation, nor the cervical glands. The appearance of the

body before the autopsy justified a provisional diagnosis of plague, which was made. Smears from one of these enlarged glands showed plague-like bacilli in great numbers. Long median incision made. Subcutaneous blood vessels distended. Muscles a little darker than normal in color, moist, unusually firm and well developed for one of this race. Peritoneal cavity opened. Intestines in normal position. Omentum very rich in fat, did not cover intestines, but was retracted up to the costal border. Blood vessels of omentum injected, but there were no hemorrhages. No fluid in abdominal cavity. Appendix normal, pointed toward pelvis. Liver extended two finger breadths below costal border, near the median line. Spleen not adherent to abdominal wall. Spleen enlarged about twice, or little less, its normal size. Of a uniform dark bluish color, with the exception of a few areas which were light pink. Section of one of these showed the characteristic wedge shape of infarct. Organ soft, showed no subcapsular nodules. Cut very easily. Cut surface very rich in blood. Slight bulging of the pulp. No connective tissue increase. Thorax opened by removal of sternum; lungs met in median line, did not completely collapse. Left pleural cavity contained about a pint of clear serum. Pleura not adherent and showed no evidence of present or previous pleurisy. Right, in same condition—that is to say, hydrothorax. Lungs crepitated throughout. Vesicles about borders distended. Organ considerably larger than normal, pitted on pressure, cut easily. Cut surface poor in blood. Air, blood and serum exuded in normal proportions. Moderate pulmonary emphysema. Pericardium opened. Contained a small quantity of straw-colored fluid. Heart surface covered with fat. Apex formed entirely by the left ventricle, which was firm and decidedly hypertrophied. Right ventricle normal in consistency and size. Vessels not tortuous. Pericardium smooth and showed neither injection of vessels nor hemorrhage, except in one small area, where there was a patch of slightly dilated vessels. Heart removed. Mitral valve very much thickened and sclerotic. Left ventricle muscle thickened, but normal in color and appearance. Aortic valves normal. Aorta showed numerous plaques, which did not, however, obstruct coronary openings. Left kidney removed. Fatty capsule unusually rich. Capsule tense, organ rather soft. Capsule strips off very easily. Cut easily. Cut surface rich in blood. Injected, blood-stained, with areas of loss or diminution in contrast between cortex and pyramids. Cortex normal in breadth (acute nephritis). Liver enlarged, soft, of a light yellowish color, interspersed with areas of venous congestion. Capsule, transparent, smooth and glistening. Cut very easily, and showed a light yellowish cut surface—was quite rich in blood. There was no increase in connective tissue, nor change in the structural appearance, fatty infiltration and congestion being the only abnormal conditions. Bladder one-half full; peritoneal surface slightly injected. No involvement of the iliac glands on either side. Mesenteric glands not enlarged, mesentery very rich in fat. Intestines appeared normal. Stomach empty, but not injected. Gall-bladder moderately distended, but emptied on pressure. Anatomic diagnosis: Chronic endocarditis, pulmonary emphysema, fatty infiltration of the liver, double hydrothorax, acute nephritis, acute adenitis, the latter probably due to plague infection. Probable cause of death, bubonic plague. Smears from the spleen showed plague-like bacilli in small numbers. The organisms from the inflamed glands and from the spleen were morphologically and tinctorially pest-like. Animal inoculation was positive. This man died after an illness of only a few days and was attended by a Chinese physician. The origin of the infection could not be traced.

*Fifty-sixth Case:* Chin Kee, a Chinese male about 25 years of age, died, May 25, at 811 Jackson Street. He had a very large bubo in the left axilla. The glands were very large, dark purple, hemorrhagic and necrotic. Smears from the glands showed numerous plague bacilli. No autopsy was performed.

*An Unscited Case,* May 26, Lum Ying Heu was autopsied at the Federal morgue. He was 25 years of age and died at 847½ Clay Street, at 9 a. m. of the same day. There was very slight enlargement of the glands of the groins and axilla and they were slightly injected. No regular bubo. A very few bipolar bacilli were found in smears from the glands and spleen. The man had been sick four days with high fever commencing with chill. This may turn out to be another case of plague. No other cause of death found at autopsy. Animal inoculations not completed.

*Fifty-seventh Case.*—Hong Quai, aged 4, died at 742 Pacific Street, May 29. Body that of a well-nourished, well-developed Chinese boy, showing no external marks of violence and having the postmortem rigidity and lividity generally well marked.

The distal phalanges of the thumbs were flexed under the fingers. The skin was free from exanthem, but on both legs were several scratch marks. The joints seemed normal, as did the genito-perineal region. There were no visible lesions on the scalp. On the right neck there was a visibly and palpably enlarged post-cervical gland, about 7 cm. in diameter, which was firmly seated. Exuding from the nose and mouth was a frothy discharge. There was a visibly and palpably enlarged gland, about 6 cm. in diameter, and immovable in the left axilla. The omentum was somewhat injected and covered the intestines, which were clear, moist and showed no hemorrhages. The true pelvis was filled with a clear straw-colored serum. The gall-bladder was distended with bile which had stained the surrounding tissues. Other organs presented no extraordinary features. There was a decidedly hemorrhagic condition around the left axillary gland which showed macroscopic evidence of pest as did the post-cervical gland. Stained smears from the glands and spleen showed the presence of an organism which was morphologically the bacillus of plague.

**The Sternberg Dinner.**—A highly representative gathering took place June 13, at Delmonico's to do honor and to pay homage to the retired Surgeon-General, George M. Sternberg. Representative practitioners of the East and the West, of the North and the South, were present, and the occasion was a most enjoyable one. Dr. E. G. Janeway, in his introductory remarks, first read a telegram from Major-General H. C. Corbin, in which he offered congratulations to Dr. Sternberg and his sense of appreciation of duty well done. Dr. Janeway further remarked that on being retired at the age of 64 it could well be said that Dr. Sternberg did not retire on any grounds of insufficiency; he was not responsible for the date of his birth, and it was by Act of Congress that he was forced to give up this particular line of activity. He expressed the hope, however, for this illustrious student of bacteriology, Fellow of the American Association of Hygienists, Commissioner on the Study of Yellow Fever, author and worker, that many years would be left him in which he could carry on his work.

In response to this toast General Sternberg said that words failed him in which to express his high appreciation of the compliment paid him by making him the guest of honor. Such a compliment, coming from the leading members of the medical profession at a time when by the operation of law he had reached the end of his active service as a medical officer of the Army, was especially gratifying. Accepting this testimonial as evidence of approval of his efforts for the promotion of medical science and of the interests of the Medical Corps of the Army, he thanked one and all most sincerely. At the same time he felt that the results accomplished have fallen much below his earnest desires and perhaps have not been commensurate with the opportunities he had had. His efforts in the field of etiology and prevention of infectious diseases were made at a time when no one in this country was prepared to give instruction in methods of research, and he was to a large extent thrown on his own resources. The tubercle bacillus, the typhoid bacillus and many other well-known pathogenic micro-organisms had not yet been discovered and a most promising field of investigation was presented to his view, for he was strong in the belief that infectious diseases must be due to infectious agents capable of self-multiplication—i. e., to living disease germs. It so happened that the principal problem which he was called upon to solve was one of the most difficult that has engaged the attention of investigators, and one in which bacteriological methods have proved to be of no avail except in establishing a negative proposition—i. e., that yellow fever is not due to a micro-organism of this class. The time and persistent work devoted by him to an investigation of the etiology of this disease might have given more fruitful results had his attention been turned in some other direction, but while he met with serious disappointment in his failure to discover the yellow fever germ, he had the satisfaction of knowing that his researches cleared the way for the subsequent demonstration by Reed and his associates, of the method by which this disease is transmitted from man to man. When he commenced his research work he had to provide his own microscope and material. There not only was no bacteriological laboratory or apparatus at any military post, nor even at any medical school or university in the country. The Medical Corps of the Army is to-day in a high state of efficiency and he expressed himself proud to have been the chief of this corps *d'élite* during a period when its efficiency and usefulness had been put to so severe a test. The profession, also, has reason to be proud of its members who are attached to the military service of the country. Our senior surgeons have been called upon to fill positions of great trust and responsibility during the past four years, and have, as a rule, acquitted themselves with great credit. As chief surgeons in

the Philippines, in Cuba and in Porto Rico, they have been to a large extent responsible for the administration of the affairs of the Medical Department, and have been called on not only to protect troops from the ravages of infectious diseases, but to perform a similar service for the natives of the various islands in which American soldiers have been called to serve. In all of these islands smallpox was widely prevalent, and in all it has been practically stamped out. In Cuba yellow fever was a scourge which threatened to do us greater injury than the bullets of our foes. But thanks to Reed and his colleagues, we now know how to prevent its extension and have practically stamped it out in the city of Havana, which has for many years been its principal endemic focus in the West Indies. In the Philippines, bubonic plague has been kept in check by the strenuous exertions of our medical officers, and the latest reports indicate that it has almost disappeared from the city of Manila. Unfortunately, Asiatic cholera has recently gained a foothold in Manila and the neighboring provinces. Colonel Maus, who is at present acting as Commissioner of Public Health, is fighting this scourge with every means known to science and hopes to be able to avert a serious epidemic. As sanitarians, as surgeons, as all-round practitioners of medicine, and as scientific investigators, the Army has in its ranks many medical officers who are an honor to the Corps and to the profession. The general hospitals at the Presidio, at Fort Bayard, at Washington Barracks, and at Hot Springs, Ark., are models which bear comparison with the best civil or military hospitals in any part of the world. The same is true of our principal hospitals in the Philippines. In this country nearly every military post of any importance has a modern hospital well adapted to the requirements of the military service, provided with a well-equipped laboratory for clinical and research work, and an operating room which would be regarded with satisfaction by any surgeon accustomed to the precautions necessary for successful aseptic surgery. In closing, General Sternberg thanked his audience again and most sincerely for the testimonial of their esteem. He said: "Your endorsement of my life work is of more value to me than military honors or financial competency. I have at times felt discouraged and disposed to think that I have fallen far short of what might reasonably have been expected in view of my opportunities. But it is reserved for the very few to accomplish great things and the physician who has won the esteem of those of his profession who are best qualified to judge of his work may well be satisfied although he realizes that he has but a small share in promoting the advancement of scientific medicine and the interests of our beloved and humane profession."

Dr. Alexander H. Smith responded to the toast "The United States Army." He had watched the career of General Sternberg, and throughout the Spanish war had felt great pride in his achievements. He had seen that the medical department was not second-best, but first-best notwithstanding all the drawbacks; the results were more satisfactory and the criticism less than in any other department of the service, and Dr. Janeway then and there demonstrated that a medical man might have executive ability outside his own lines.

Colonel Henry Lippincott said that the Army and his own corps all gravitated towards General Sternberg; their respect and love reached out in his direction. The work that Dr. Sternberg had done, finding ten years ago the miserable old stuff left from the Civil war, in remodeling and reconstructing the corps so thoroughly and fundamentally, was a matter to be proud of, and they were proud to have such a medical man in the army; they honored the man who made it possible and owed him a debt of gratitude.

Speaking on the work of the Army in Cuba, Dr. William Osler, Baltimore, said that it was a happy expression, "Peace hath her victories no less renowned than war." A foe worthy of the best of America's steel had been encountered and no chapter in the history of medicine will be able to stir the blood of the American profession as will that Welch will tell of the battle of yellow fever. Here was the foe that General Sternberg had fought, and with success; he would go down to posterity with the honor of a battle long fought and valorously won. The victory was accomplished in a way that reflected great credit on the army and on the state. The work of Reed and Carroll was a piece of work well planned and well carried out, a demonstration to the entire world.

Major W. C. Gorgas said that had their work not been as successful as good fortune had made it, General Sternberg would have received the entire blame, the success was his also. When Havana was occupied in 1899 he became a health officer in the spring with no very clear idea of what to do and at first he had devoted his attention to organization and development of a sanitary department; work was started in on all lines, good as well as bad, bad as well as good. There

was little yellow fever in the spring of that year, but in the fall and winter there was a great deal. In 1900, though the general sanitary condition had immensely improved, yellow fever was still present and the epidemic was of a severe character. There were over 1400 cases, and 300 deaths, and he felt discouraged at the little progress made. In 1900 Dr. Reed, chief of the Bureau, first directed work along the lines of the theory of the mosquito infection, and he proved that the mosquito can be infected only during the first three days of the disease, and that there is a period of from 12 to 25 days when the bite of the stegomyia can convey the disease. In February, 1901, the Sanitary Department was reorganized and turned its attention to study the local conditions and their relation to the spread and development of the mosquito. The rain-barrels, the family cisterns, all breeding the stegomyia, the Chinese gardens from which came anopheles, all these were studied in much detail, and a large force of 150 men was put to work. There were but few cases of yellow fever at the time, and the mosquitoes of the neighborhood were killed by fumigation, pyrethrum powder proving a very efficient mosquitoicide. In January of 1901, the city was free from yellow fever; in July the suburbs received a certain amount of reinfection; but on Sept. 28, 1901, the last case of yellow fever occurred. Since that time the land has been practically free, since Havana has been the center of infection. The success had been due to the study of the mode of propagation, which discovery had been made possible by the enthusiastic co-operation of General Sternberg.

Dr. John A. Wyeth of New York, the retiring President of the American Medical Association, then introduced Dr. Frank Billings, the recently elected President of the American Medical Association.

Dr. Billings said that he would not feel he could add anything to what had been so well said, but that he desired to speak for the American Medical Association, the representative body of American physicians. It was a great pity, he thought, that this Association does not embrace all; the reasons for this are not hard to find, however; it is in part due to the great extent of our country and the relative difficulties in transportation facilities. But these are being steadily overcome, and he hoped the time would shortly come when the entire body medical would be found standing together with all misunderstandings laid aside; that physicians would not be considering each other as doctors, but rather as men and more particularly as gentlemen who were meeting on common ground. When that day should come, and as he saw it it was very rapidly approaching, there would be no difficulty with ethics, and the new organization which had proved so successful under the guiding administrations of Dr. Wyeth and Dr. Simmons would go forward, and that the higher standards of professional integrity and scientific research would go forward through the broadening and uplifting influences of the American Medical Association.

Dr. W. H. Welch, Baltimore, spoke of that side of the work of Dr. Sternberg most familiar to him, namely, his work in bacteriology. Dr. Sternberg, he said, was the pioneer worker in bacteriology in this country; he had been compelled to acquire the technic from reading, and we all knew how he had perfected a technic equal to that of the best. Dr. Sternberg had made many important discoveries; his work on disinfection and disinfectants would stand as a monument alone. It was as the first and isolated micro-organism of pneumonia, and his work with yellow fever would stand forever. He said that it was so common a thing, in these busy days, to forget the steps which led up to any important discovery. All that Dr. Sternberg had done in the study of yellow fever was necessary work and it had to be done in just the way that he did it. The ground had first to be cleared; if it were not so the discovery would not have been possible, and later discoverers themselves would have had to hunt out the large host of micro-organisms which Dr. Sternberg had described and laid aside. This careful work had practically resulted in the view that a bacteriological origin for this disease could not be claimed, and it was on a priori grounds that he himself had felt that Sanarelli's bacillus was not the cause of yellow fever. His study of others' discoveries was most careful, and most critical; it was not wasted endeavor. The problem still remains, however, what the cause is, although the method of eradication has been demonstrated in a most complete and authoritative way. He expressed the wish that Dr. Sternberg would come back to his old love, and to his test-tubes, and he welcomed him to many years of fruitful work.

#### Smallpox.

Indiana: Smallpox is the most prevalent malady. It was reported from 60 counties. The total number of cases reported was 692, with one death. The greatest number, 53, was re-

ported from Knox County. In the preceding month 878 cases of smallpox were reported in 55 counties and six deaths. It appears, therefore, that cases and deaths decreased, but area of prevalence increased.

Ontario: Dr. Bryce, secretary of the Ontario Board of Health, says that the smallpox situation in the province is getting better gradually. He hopes to see the province clear of the disease in a month or two. Two or three new cases have developed in Toronto in the past two weeks.

London: The number of patients in the metropolitan hospitals, which had been 1419, 1360 and 1344 in the three preceding weeks, has further declined to 1274; 251 new cases were admitted during the week, against 248, 233 and 307 in the three preceding weeks. During the fortnight ending May 29, 580 cases were admitted as compared with 478 in the preceding two weeks; 78 died, as compared with 91, and 577 were discharged recovered, as compared with 467. During the year 1901 the rate of smallpox mortality was 16.1. The epidemic began on August 20, and therefore has now lasted nine months. It is anticipated that in the next three months it will proceed at a much slower rate. From the metropolitan area alone nearly 7500 cases have been received, giving an incidence of about 1 in every 615 of the population. Local outbreaks have from time to time occurred, but they have been stamped out by the vigilance of the health authorities. Large sums of money have been spent in providing extra accommodation which, in a few weeks, will be ample for all purposes—sufficient for 3000 or 4000 patients. At present there is accommodation for 1800. The maximum number under treatment during the present epidemic has been 1604.

#### CANADA.

**Medical Society in Nova Scotia.**—The next annual meeting of the Medical Society of Nova Scotia will be held on July 2 and 3 at New Glasgow.

**Maritime Medical Association.**—The next annual meeting of the Maritime Medical Association will be held at Charlottetown, P. E. I., on July 9 and 10.

**Militia Medical Course.**—The course of instruction for the medical officers of the Canadian militia has commenced at Ottawa. Surgeon-Major Gorrell of Ottawa is in charge.

**Kingston Medical and Surgical Society.**—The following have been elected officers of the Kingston Medical and Surgical Society for the ensuing year: President, Dr. W. T. Connell; vice-president, Dr. Forster; secretary, Dr. Mylks.

**Resignation and New Appointment.**—Dr. R. F. Ruttan has resigned the registrarship of the Medical Faculty of McGill University. He has been appointed professor of chemistry in succession to Dr. Girdwood. He has been registrar for the past eleven years.

**Medical Examinations at McGill.**—McGill held her closing exercises last week, a very large graduating class in medicine receiving diplomas. This year the Holmes gold medal goes to the province of New Brunswick, that honor having been won by Mr. R. McL. Van Wart, B.A., Fredericton.

**Montreal General Hospital Superintendent.**—Dr. E. M. Von Eberts, for some years the medical superintendent of the Montreal General Hospital, will leave that institution September 1. Dr. W. G. Turner, senior house surgeon, has been appointed his successor. Dr. Turner was graduated two years ago from McGill, and has since been connected with the hospital.

**Toronto University Convocation and Alumni Meeting.**—The annual commencement exercises at Toronto University were held June 13. Among those who received the honorary degree of Doctor of Laws were: President Ira Remsen of Johns Hopkins University, Dr. W. H. Drummond, the doctor-poet of Montreal, and Dr. R. A. Reeve, dean of the medical faculty. A very large class received the degree of M.B. Dr. R. A. Reeve was re-elected president of the Alumni Association.

**Rockefeller Appointments.**—Dr. W. M. Ford, who was appointed Rockefeller fellow of bacteriology on the foundation of that benefaction at McGill last year, has been appointed one of the investigators at the Rockefeller Institute at New York. The choice of his successor has been left to the faculty. Dr. P. G. Woolley, fellow in pathology at McGill, has been appointed bacteriologist in the United States bacteriological laboratories at Manila.

**Ontario Asylum Changes.**—Owing to the recent death of Dr. Reynolds, of Hamilton, Ont., Asylum, at Baltimore, several changes have been rendered necessary in the Ontario asylum service. Dr. Beemer, assistant superintendent of the asylum at London, has been appointed assistant superintendent at

Hamilton. Dr. Bell of the Toronto Asylum has been transferred to London, while Dr. J. C. Mitchell, recently elected president of the Ontario Medical Association, Enniskillen, has been appointed assistant physician at Toronto Asylum.

**Staff Appointments, Royal Victoria Hospital, Montreal.**—The Royal Victoria Hospital, Montreal, has made fifteen appointments to the resident medical staff for the year ending August 31, 1903, as follows: Admitting officer, Dr. A. G. McAuley; medicine, Drs. Colin K. Russell, W. W. Francis, J. R. Byers, J. C. Colby; surgery, Drs. E. Penner, E. J. Mullally, J. D. Dixon, J. L. D. Mason; ophthalmology and laryngology, Dr. Newbold C. Jones; gynecology, Dr. James R. Goodall; anesthetist, Dr. L. C. Harris; locum tenens, Drs. Herman K. Stockwell and J. A. MacNaughton; externe in medicine, Dr. F. C. L. Cantlie.

**Medical Library for Halifax.**—The late Dr. Charles Cogswell of London, N. S., donated \$5000 to the Medical Society of Nova Scotia, the interest of which is to be applied toward a library for the profession in Nova Scotia. The Halifax Medical College has also received several donations of books and journals, and a joint committee of these two bodies is endeavoring to make arrangements by which the profession may take advantage of these donations. Halifax is to have a magnificent library building for the public through the generosity of Mr. Carnegie, and it is proposed that the medical profession take steps to secure a share of the space available for books.

### FOREIGN.

**New Mexican Hospital.**—Seven hundred thousand dollars have been raised for the construction of the new hospital at Merida, Mexico. The grounds have been purchased and work on the institution will commence at once.

**Hongkong Quarantine Raised.**—The quarantine, which for about two months had been in operation at Hongkong, was raised May 1, and vessels from that port are free to enter United States ports unless sickness should develop on board during the voyage.

**Deaths in the Profession Abroad.**—Professor Polaillon of Paris; Professor Chartier of Nantes; A. Guarino, professor of clinical medicine at Naples, and K. von Böhm, Vienna, for years chief of the general hospital and prominent as an expert in questions of ventilation.

**Congress of Medical Examiners for Insurance Companies.**—It is announced that the third international congress will be held at Paris in May, 1903. Brouardel will preside, and A. Siredey has been appointed secretary general. For further particulars address the latter at rue Taitbout 180, Paris, France.

**Honors to Lacordaire.**—The *Gazette Méd. de Paris* observes that in doing honor to the memory of Rochambeau the people of the United States should also recall the name of Dr. Lacordaire. He was a physician who accompanied the French troops to aid us in our struggle for independence. He served as a private soldier and died in France in 1804.

**Queen Wilhelmina's Physicians Honored.**—Professor Roosenstein, the pathologist of Leyden University, has been promoted to the rank of Commander of the Order of the Lion of the Netherlands, and Drs. Konwer, Roessingh and Pott have been appointed knights of the same order, in recognition of their services to Queen Wilhelmina of Holland in her recent sickness.

**The Approaching International Medical Congress.**—Among the Germans who have promised to deliver addresses at Madrid, in 1903, are Leopold on "Treatment of Placenta Previa"; Krause on "Laryngeal Tuberculosis"; Hoffa on "Tuberculosis of the Joints"; Leyden on "Subdural Cocainization"; Ehrlich on "The Hypnotica," and Liebreich on "The Relations Between the Chemical Composition and the Physiologic Action of Drugs."

**Discuss Licensing Prostitution in Sweden.**—The Society of Physicians of Sweden is divided on the wisdom of the system now in use in that country of state regulation of prostitution. A request has been made by the women of the country to abolish the system. Seventy-two physicians condemn the proposal entirely; sixty, while unable to agree with the women, declare that radical reforms in vice regulation are imperative and recommend that the board of health supersede the police as regulators of vice and surround the problem with elaborate legal formalities instead of leaving it to the whims of police officials. It is also suggested that municipalities establish homes where erring girls can obtain a new start in life.

**Centennial of the "Internat" in France.**—The French minister of the interior at the commencement of the nineteenth century was a physician, and he founded the system of interne service in the hospitals, with competitive examinations. The centennial of this institution was celebrated at Paris, May 24, with much ceremony. The festivities lasted three days and included a banquet and a gala celebration at the Opera Comique, when a series of musical and dramatic sketches of various phases of interne life were presented, with one act from Molière's "Médecin malgré lui." A handsome monument was dedicated to the memory of the internes who have died victims of their professional duties. Thirty-five names are inscribed on the pedestal, and the scene in relief on the monument portrays a tracheotomy on a suffocating child done by an interne and two assistants, with a Sister of Charity holding the child's head. This scene was selected, as many of the internes succumbed to diphtheria contracted during these emergency operations. The monument stands in the inner court of the Hotel Dieu.

### LONDON LETTER.

#### Losses in the Boer War.

The War Office has issued a detailed return of the total British losses in the Boer war from the commencement, on Oct. 11, 1899, to May 31 last, the day on which peace was declared. The total casualties are 97,477, but this huge total includes over 75,000 sent home as invalids the great majority of whom have recovered. The actual reduction of the military forces through the war is 28,434, which is made up as follows: Killed in action, 5774; died of wounds, 2018; died in captivity, 102; died of disease, 13,250; accidental deaths, 798; missing and prisoners, 105; invalids sent home who have died, 508, and invalids who have left the service unfit, 5879. The total number wounded in the war is 22,829.

#### Reunion of Obstetricians and Gynecologists.

On the occasion of the coronation arrangements have been made for a reunion of obstetricians and gynecologists. A reception will be held at the Royal Medical and Chirurgical Society's rooms, 20 Hanover Sq., June 24, by Sir John Williams Bart., M.D., Dr. Peter Horrocks (President of the Obstetrical Society) and Dr. Halliday Croom (President of the British Gynecological Society). To this reception all medical practitioners interested in obstetrics and gynecology are invited. It is hoped that not only the obstetricians and gynecologists of London, but also those from Great Britain, the Colonies, and abroad, who may be in London at the time, will be brought together. A dinner will take place in the Whitehall Rooms, Hotel Metropole, under the chairmanship of Sir John Williams.

#### Ear Disease in the Children of the Poor.

The Committee of the Otological Society appointed to consider the desirability of securing for the children of the poorer classes systematic detection and treatment of ear disease, have arrived at the following conclusions: (1) There exists among the children of the poor a large amount of preventable and curable ear disease. (2) It is not sufficiently recognized that ear disease in childhood tends to considerable loss of hearing, health, and life, and militates against the child's education. (3) Ear disease in children is often not treated, partly from neglect, partly from ignorance and belief in popular fallacies, especially inability of parents and teachers to detect it. (4) Any scheme to secure children against the consequence of ear disease must provide for thorough systematic examination and treatment. (5) In consequence of the national importance of the subject we recommend that a memorial embodying this report be submitted to the President of the Committee of the Council on Education.

#### Why Men Become Doctors.

Many years ago, in 1869, Sir James Paget published a most interesting essay on "What Becomes of Medical Students?" He found that of 1000 students at St. Bartholomew's Hospital, 23 achieved distinguished success, 66 considerable success, 507 fair success, 124 very limited success, 56 failed entirely, 96 left the profession, 87 died within 12 years of commencing practice, and 41 died during pupilage. Dr. A. Keith, lecturer on anatomy at the London Hospital, has investigated the supplemental subject, "The motives which induce men to adopt medicine as a profession." His results are equally interesting. He finds that 100 London hospital students may be divided into seven groups, composed as follows: (1) 7 had no choice, the profession was chosen for them; (2) 30 were born in the profession and grew up in it; (3) 10 adopted it as a boyish ideal at a very early age; (4) 12 adopted it by a process of exclusion—it was the profession they had the least objection to; (5) 7 chose it because it was the nearest akin to their favorite subjects—zool-

ogy or chemistry; (6) 31 adopted it from some accidental circumstance; (7) 3 drifted into it—they could not tell why. Sir Benjamin Brodie, the eminent surgeon, belongs to the first class. More than a century ago he was sent to St. George's Hospital by his father, a vicar. His heart was in literature and philosophy, but by the application of a strong sense of duty, medical study, which at first was repulsive, became tolerable and at last fascinating. Of the 7 men in this group one became a distinguished success, one will become a distinguished success, 3 will become average successes and 2 still object to medicine and would willingly give it up. Three acquiesced passively in their father's wish, 4 objected actively; the 2 who still object belong to the latter group, but one of them, at least appears likely to do well in practice. While the second group does not show a large proportion of distinguished successes, it also shows only a small proportion of failures. If heredity played any part the largest proportion of success and distinguished successes should be in this group. One member is the sixth of a consecutive series of medical generations, and 3 belong to a third generation. Thus there is nothing approaching in medical caste in England, and inheritance of distinguished professional ability is comparatively rare. Of the 10 in group 3, 2 are already distinguished successes, 4 are still young, but will be or are already considerable successes. The remaining 4 are or will be successes. Many men select medicine by a process of exclusion. Most of these had drifted on late at school or at the university, putting off the choice of a profession as late as possible. This list does not contain any distinguished success, but the great majority have or will enjoy more than an average amount of success. Very few are failures. As a rule they turn out first-class clinicians. As the natural sciences which form the groundwork of medicine do not offer the same certainty of a livelihood as medical practice many men with a taste for zoology or chemistry adopt medicine. Only 7 have been included in this group because in them this taste was the sole or principal factor in determining their choice, but there were quite as many in other groups with a predilection for natural science. Of these 7, 2 are distinguished successes; all the others are more than average successes—perhaps less in income and practice than in reputation. Of accidental circumstances which led men into medicine, Dr. Keith instances a love of horses, companionship and rivalry. This group, as might be expected, includes all sorts and conditions of medical men—the faddist pure and simple, the scientist, and the able surgeon, the happy-go-lucky, and the absolutely incompetent individual. It embraces the extremes—the solid successful practitioner forms a minority. The last group—of men who can not tell how or why they entered medicine—is small, but it shows the haphazard manner in which men set out on their course of life. The age at which men select medicine as a profession varies widely: 10 did so very early, at 6 or 7; 27 early, at 10 to 14; 33 about 16; 17 before 20, and 13 after 20.

## Correspondence.

### The Physician and Marriage.

DENVER, JUNE 10, 1902.

To the Editor:—At a recent meeting of a medical society the subject of how physicians may aid in securing proper marriage restrictions was discussed. One physician took the ground that the matter lay in the hands of the medical profession; that if the latter would make it a point to advise their constituents, that a great deal could be accomplished. A second thought a health certificate should be required as well as a license to marry. Another physician said his experience would not bear out the statement that the family physician could be of much service to the state by gratuitous advice. He gave it as his judgment that after two young people had determined to marry it was too late for the family physician to offer any suggestion; that whatever the physician could do had to be prior to that time.

The experience of every physician will bear out the statement that it is seldom that a physician's advice is sought in such matters, and that when given it is generally not taken. The proper solution of marriage restrictions is an important question, but it is doubtful if even a certificate from the family physician would solve it. E. g. I know of a family into which a physician would not allow a child of his to marry on account of hereditary disease. Yet, if asked by an outsider he would never have said anything that would have impaired the matrimonial

chances of that family because of his relation to them. My attention has recently been drawn to this question in the loss of two infants. Three years ago, M. C., a young man of high moral character, but scrofulous from childhood, married a neurasthenic girl, the latter's parents being extremely delicate. A child was born—scrawny, a very thin body, and in a month a marked case of mal-nutrition. Every care could not save it. It lacked from birth what its parents failed to give it *vis natura*. The second was that of a baby, both of whose parents were very small. Consumption was hereditary on one side and catarrh on the other. This baby was exactly like the former. Change of climate, consulting eminent physicians in the east proved of no avail; it died because it had not been well born. Yet the entire family would resent what is evident to any student of heredity—those parents should not have married each other. It might have been possible for any one of them to have married partners when the offspring would have been different. Yet the family physician knew that nothing else could be expected. An article in the *Columbus Med. Jour.*, September, 1898, says: "Heredity takes the line of least resistance." In the above cases heredity simply followed the line of least resistance. Here is a case under my own observation at present: Mr. K. is engaged to marry Miss B. K. suffers from chronic vulgaris pemphigus, family history fair. Miss B. belongs to a consumptive family. Every aunt and uncle who have reached maturity have died of consumption. K. is aware of his own condition as well as Miss B.'s family history. He might in his condition marry a strong, healthy girl, with a clear family record and marry with impunity. Scrofula would be the line of least resistance in his present marriage.

A greater interest in the problem on the part of the profession at large and more education for the laity is probably as much as can be accomplished at present until we come to marry as much for our children as for ourselves.

FRANCIS DEAN.

### Outlining the Stomach.

BUFFALO, JUNE 16, 1902.

To the Editor:—The method of outlining the stomach proposed in your issue of June 14 by Dr. Wilhelm Becker may be still further simplified. The location of the stomach in a general way, by auscultation of some noise made within it, either by blowing air through a tube, producing bubbles by introducing air from beneath the surface of water, employing a whistle, bell, electric buzzer, etc., has been practiced for years. Dr. Becker's device depends upon the general principle of visceral transonance, better known under its common subdivision of auscultatory percussion. I have occasionally been able to map out the stomach by the vibrations set up by the heart beating against the distended stomach and have sometimes taken the trouble to do so during the use of my endogastric spray, which is, for present purposes, practically identical with Dr. Becker's method.

The only objection to such a method is the unnecessary trouble involved. We may just as well set up vibrations from without as from within, as by the ordinary method of auscultatory percussion, which has been too much neglected. In cases in which the colon is so much dilated and distended as to have nearly the same vibration tone as the stomach, it may be impossible to distinguish their line of separation and the false conclusion of an enormously dilated stomach will be drawn. In such instances, I have been able to make the differentiation by inducing vibrations with a tuning fork. (See latest issue of *International Clinics*.)

A. L. BENEDICT.

### Ophthalmoscope Loaned by Dr. Derby.

BALTIMORE, JUNE 14, 1902.

To the Editor:—My attention has been called to an error in my address on the "History of the Ophthalmoscope," published in the issue of March 1, 1902. On page 551, the loan of Ruete's ophthalmoscope is incorrectly ascribed to Dr. Jeffries. Dr. Hasket Derby of Boston loaned this rare instrument and a number of others, and has since then given them to the Museum of the Surgeon General in Washington. Yours,

HARRY FRIEDENWALD.

**Married.**

MAX MAILHOUSE, M.D., to Miss Celia B. Katz of Chicago, June 3.

FREDERICK MENGE, M.D., to Miss Alberta Richards, both of Chicago, June 11.

WARD E. POTTER, M.D., to Miss Ida Belle Bradley, both of Chicago, June 19.

WILLE C. KNIGHT, M.D., to Miss Mildred Read, at Newport News, Va., June 4.

LOUIS H. JONES, M.D., to Miss Emily Johnston, both of Wall Lake, Iowa, June 5.

R. J. MITCHELL, M.D., to Miss Bertha Leyhe, both of Lancaster, Mo., May 29.

EDWIN F. YANCEY, M.D., to Miss Beulah Harris, both of Sedalia, Mo., June 4.

JOHN PASCHAL, M.D., to Miss Julia Kate Tucker, both of Hurtsboro, Ala., June 5.

HENRY VON DEESTEN, M.D., to Miss Etta Lang, both of Hoboken, N. J., May 26.

JOHN M. YEAGER, M.D., to Miss Mollie May Smith, both of Marlinton, W. Va., June 4.

DAVID H. REEDER, M.D., Chicago, to Miss Maude Angela Warner, Baltimore, May 29.

ANGUS McEACHERN, M.D., to Miss Jennie Hamilton Hislop, both of Detroit, Mich., June 4.

ADOLPH TYROLER, M.D., Williams, Ariz., to Miss Freda Barth of Albuquerque, N. M., June 2.

LISTON H. MONTGOMERY, M.D., to Mrs. Olive Branch Montgomery, both of Chicago, June 8.

W. C. TAYLOR, M.D., Branchville, Texas, to Miss Nona Gladden, at Calvert, Texas, May 18.

WILLIAM AUSTIN GOODALL, M.D., to Miss Elizabeth Anderson, both of New York City, May 11.

LOUIS J. GORDON, M.D., to Miss Mollie Smith, both of Poca-hontas, Ill., at St. Louis, Mo., May 29.

A. C. VANDINE, M.D., Clendennin, W. Va., to Miss Nora Osborne, at Charleston, W. Va., June 4.

SOL M. HARTZELL, M.D., Cleveland, Ohio, to Miss Elsa Leona Hirshberg of Youngstown, Ohio, June 3.

EDWIN A. LONG, M.D., Johnson City, Tenn., to Miss Jane Pierson Hardy of Bristol, Tenn., May 28.

FRANCIS MICHAEL O'GORMAN, M.D., to Miss Gertrude Elizabeth Hart, both of Buffalo, N. Y., June 10.

WILLIAM B. WELCH, M.D., Fayetteville, Ark., to Miss Julia Garside of Colorado Springs, Colo., June 5.

HENRY EVERETT MONROE, M.D., Oakland, Ill., to Miss Irma Enfield Tackett of Shelbyville, Ill., June 4.

MARVIN GRIMES, M.D., Hardin, Mo., to Miss Maud Andrews of Norborne, Mo., at St. Louis, Mo., May 27.

ARTHUR EDWIN BEYER, M.D., Guttenberg, Iowa, to Miss Jessie Edythe Morse of Elkader, Iowa, June 4.

GEORGE BIXFORD VAN DOREN, M.D., Watertown, N. Y., to Miss Emma Cooper of Syracuse, N. Y., June 4.

GEORGE DELAVAN UPSON, M.D., Cleveland, Ohio, to Miss Louise Catherine Tiedemann of Chicago, June 11.

HARVEY SIDNEY SMITH, M.D., East St. Louis, Ill., to Miss Lucy Maud Clanahan of Springfield, Ill., June 11.

CHARLES EDWIN BRIGGS, M.D., Calumet, Mich., to Miss Jean Hamilton McDermaid, at Seaford, Ontario, June 7.

TRAFFORD B. SALISBURY, M.D., to Miss Minnie Shreve Busbey, both of New York City, at Tucson, Ariz., June 2.

FRANCIS H. GLAZEBROOK, M.D., Morristown, N. J., to Miss Grace Eugenie Squire of Elizabeth, N. J., June 3.

EDWIN GLADMON, M.D., Southern Pines, N. C., to Miss Catherine Melden Grover of Raleigh, N. C., May 17.

EDGAR C. HUDDLESTON, M.D., Hannibal, Mo., to Miss Ella Lavoo of Carriers Mills, Ill., at Harrisburg, Ill., June 2.

JUD MITCHELL, M.D., Atchison, Kan., to Miss Beatrice Mahan, of St. Joseph, Mo., at Leavenworth, Kan., May 26.

HOWARD E. BACRETT, M.D., Mountairn, Texas, to Miss Mattie Kirkland of Axtell, Texas, at Waco, Texas, June 4.

LEO FRANK ADT, M.D., Troy, N. Y., to Miss Edith Moore of St. Croix, Danish West Indies, at New York City, June 3.

MA ION SIMS MIDDLEKAMP, M.D., Colorado Springs, Colo., to Miss Rose Koeb, of Palmyra, Mo., at Colorado Springs, Colo.

ALBERT T. CHAMBERS, M.D., of the Baltimore Health Department, to Miss Marguerite E. Linthicum, of Baltimore, June 5.

JOHN ALEXANDER ARBUCKLE, M.D., Lewisburg, W. Va., to Miss Jessie Wallace Marshall of Richmond, Va., at Baltimore, June 3.

CHARLES NORTON BARNEY, M.D., First Lieutenant and Assistant Surgeon, U. S. Army, Key West Barracks, Fla., to Miss Helen Bourdel Young of Morristown, N. J., June 5.

**Deaths and Obituaries.**

George Worth Woods, M.D., medical director (rear admiral) U. S. Navy, retired, died at San Francisco, June 10, aged 64. Dr. Woods was well known in army and navy circles, was a frequent contributor to the literature, and was an active member of the Association of Military Surgeons of the United States. His last duty prior to his retirement was that of medical director at the U. S. Naval Hospital, Brooklyn, N. Y. In his memory one of his friends at Vallejo, Cal., says "Beloved Dr. Woods! He whose great heart was filled with love and sympathy and human kindness, is no more, yet must the memory of his unselfish life ever be uplifting to those who knew his love or were soothed by his ministrations. Nowhere will he be more deeply mourned than in Vallejo, and the Navy Yard, although among his friends are numbered those from every clime."

Stephen Henry King, M.D. Harvard Medical School, Boston, 1872, who sailed for Europe, May 21, died in London, June 5, from pneumonia, aged 58. Dr. King has been a resident of Baltimore for several winters past, and was a well-known figure in Johns Hopkins circles. Dr. King was a native of Lowell, Mass. He practiced in Lowell, Mass., and Providence, R. I., until 1892, when he moved to Baltimore and took special courses in Johns Hopkins University.

Agnes B. Robinson-Messner, M.D. Woman's Medical College of Pennsylvania, Philadelphia, 1896, died at her home in Philadelphia, June 5. She was the daughter of the late Dr. Charles M. Robinson, of Philadelphia. On graduation she received the gold medal for the year. In 1901 she also won the John B. Deaver prize. She was assistant demonstrator of anatomy at the Woman's Medical College.

Allen Jones, M.D. Western Reserve University, Cleveland, Ohio, 1853, who had practiced in Trumbull County, Ohio, for nearly 50 years, had twice represented the county in the general assembly, and served throughout the Civil war as surgeon of the Thirtieth Ohio Volunteer Infantry, died at his home in Kinsman, June 7, after a lingering illness.

Curtis E. Munn, M.D. Harvard University Medical School, Boston, 1866, a pioneer physician of Kansas, a member of the American Medical Association, bacteriologist of the State Board of Health, lecturer on hygiene and sanitation at the State University and lecturer on bacteriology at Kansas Medical College, died at Topeka, June 7.

Gilman P. Robinson, M.D. Harvard University Medical School, Boston, 1893, lecturer on diseases of children in the Atlanta College of Physicians and Surgeons, and a specialist on that branch, died at his home in Atlanta, May 26, from tuberculosis and nephritis, after an illness of several months, aged 46.

Otis R. Freeman, M.D. Dartmouth Medical College, Hanover, N. H., 1843, who is said to have been the oldest practicing physician in America, died at his home in Freehold, N. J., June 9, after a short illness, aged 92. During the Civil war he served as surgeon on the staff of General Corcoran.

John Sell Edmund Cotman, M.R.C.P., Edinburgh, 1882; L.R.C.S. Edin. and L.M., 1889; L.S.A., 1879, a member of the common council of London, England, was found dead by the roadside at Langdon Hills, England, May 30, aged 54. His death was due to heart failure and heat exhaustion.

Samuel R. Cochrane, M.D. University of Buffalo, N. Y., 1867, surgeon of the One Hundred and First New York Volunteer Infantry in the Civil war and for more than 30 years a practitioner of Albion, N. Y., died at his office in that town, May 24, from an overdose of chloroform, aged 63.

T. Ritchie Stone, M.D. University of Vermont, Burlington, 1884, a prominent physician of Washington, D. C., and a member

of the staff of the Emergency and Columbian University hospitals, died suddenly at his home, June 1, from angina pectoris following an attack of acute indigestion, aged 45.

**Joseph Scholl, M.D.** University of Tuebingen, Germany, 1850, a resident of Washington, D. C., since 1861, one of the oldest members of the local medical society and one of the incorporators of the Emergency Hospital, died at his home in Washington, June 6, aged 79.

**William D. Duff, M.D.** Missouri Medical College, St. Louis, 1876, for 15 years a practitioner of Garden Grove, Iowa, but for the last year a resident of Blockton, Iowa, was shot and instantly killed in Garden Grove, June 7, by a farmer with whom he had had trouble.

**Newton P. Holdom, M.D.** Rush Medical College, Chicago, 1846, who settled in Illinois in 1836, was an Argonaut of 1849, and served as county physician of Cook County in 1876 and 1877, died at the home of his son in Detroit, Mich., June 8, aged 81.

**James W. Jennings, M.D.** Cincinnati College of Medicine and Surgery, 1873, who retired from practice at Millersburg, Ind., a year ago, died at the home of his daughter in Lima, Ohio, May 30, after an illness of ten months, aged 64.

**Andrew T. Steele, M.D.** Rush Medical College, Chicago, 1875, a member of the Aesculapian Society of the Wabash Valley, died at his home in Charleston, Ill., May 27, from paralysis, after an illness of ten months, aged 57.

**John B. Wilson, M.D.** Kentucky School of Medicine, Louisville, 1888, of Laramie, Wyo., a member of the American Medical Association, died at a hospital in Denver, Colo., where he had undergone an operation on the liver, May 20.

**James A. Black, M.D.**, 1894, a practitioner of Bond County, Ill., for 35 years, assistant surgeon of the Forty-ninth Illinois Volunteer Infantry in the Civil war, died at his home in Pleasant Mound, June 1, after a short illness, aged 67.

**Thomas J. Brown, M.D.** Vanderbilt University, Nashville, Tenn., 1885, died at Johns Hopkins Hospital, Baltimore, May 26, aged 39. Dr. Brown had practiced in Pratt City for several years, until his health failed about a year ago.

**G. F. German, M.D.**, a veteran of the Seminole war, an assistant surgeon in the Mexican war and a practitioner in Texas until 1884, when he moved to Ellensburg, Wash., died at his home in that place, May 23, aged 83.

**John D. Hayes, M.D.** Columbus (Ohio) Medical College, 1878, a member of the American Medical Association, and prominent as a physician and citizen of Somerset, Ohio died at his home in that city, May 18, aged 49.

**Hezekiah P. Meade, M.D.** New York Medical College, New York City, 1853, for 45 years a practitioner of Morrisville, N. Y., died at his home in that place, May 24, from malignant disease of the throat, aged 72.

**John R. MacKenzie, M.D.** University of Nashville, Tenn., 1862, late mayor of Weatherford, Texas, and an ex-confederate soldier, died at his home in Weatherford, May 26, after an illness of two weeks, aged 68.

**Emmons Thomas Wilcox, M.D.** New York University, 1876, a well-known physician of Frankville, Iowa, died in a hospital in New York City, May 26, shortly after an operation on the kidney, aged 50.

**William Craig Burke, M.D.** New York University, 1844, for many years a practicing physician of New York, died at the residence of his son in Cheyenne, Wyo., May 24, after a brief illness, aged 90.

**William Christie Wilson, M.D.** Tulane University, New Orleans, La., 1848, died at his home in New Orleans, from paralysis, June 8, aged 78. He had practiced in New Orleans for more than fifty years.

**Moses D. Schmalhorst, M.D.** Beaumont Hospital Medical College, St. Louis, 1893, of St. Louis, Mo., died, June 2, from sepsis at the Rebekah Hospital, St. Louis, after an illness of several weeks, aged 35.

**James Hayes, M.D.** Toronto (Ont.) University, 1866, died suddenly at his home in Simcoe, Ont., May 30. He was at one time mayor of the town and was for several years chairman of the local school board.

**John J. Briley, M.D.** Western Pennsylvania Medical College, Pittsburg, 1896, died at his home in Lawrenceville, Pa., June 4, from typhoid fever, after an illness of two weeks, aged 28.

**Andrew L. Longshore, M.D.** College of Physicians and Surgeons, Baltimore, 1893, died at his home in Newberry, S. C.,

May 29, from typhoid fever, after an illness of three weeks, aged 33.

**Gaylord Brown Miller, M.D.** Berkshire Medical College, Pittsfield, Mass., 1852, died at his home in Grand Rapids, Mich., May 25, from paralysis, after an illness of three weeks, aged 71.

**Benjamin A. Church, M.D.** New York University, 1878, died suddenly from heart disease associated with long-standing nephritis, June 5, at his home in Oneonta, N. Y., aged 47.

**William Mason, M.D.**, at one time dean of the faculty of medicine of Buffalo, N. Y., died at Vergennes, Vt., June 1, from general paresis, after an illness of several years, aged 64.

**Stephen A. Young, M.D.** Cooper Medical College, San Francisco, Cal., 1876, died at his home in Portland, Ore., May 29, from paralysis, after an illness of four years, aged 62.

**Samuel C. Fitzgerald, M.D.**, U. S. Army, died at the United States General Hospital at Washington Barracks, D. C., June 1, from abscess of the liver, after a prolonged illness.

**Andrew P. Nelson, M.D.** Vanderbilt University, Nashville, Tenn., 1884, died at his home in Winchester, Tenn., May 24, from tetanus, after an illness of one week, aged 40.

**Fletcher W. Brockway, M.D.** University of Buffalo, N. Y., 1883, was instantly killed by being thrown from a wagon, near his home in Erin, N. Y., May 30, aged 49.

**W. D. Buchanan, M.D.** University of Vermont, Burlington, 1882, for many years a practitioner of Cambridge, Vt., died at his home in Jeffersonville, Vt., March 25.

**Walter R. Godfrey, M.D.** Rush Medical College, Chicago, 1852, a pioneer physician of La Porte County, Ind., died at La Porte, June 7, at an advanced age.

**Walter S. Kearney, M.D.** Leonard Medical College, Raleigh, N. C., 1891, assistant city physician of Huntington, W. Va., died at his home in that city, May 23.

**O. M. Starr, M.D.** Atlanta (Ga.) Medical College, 1880, died at his home in Newnan, Coweta County, Ga., May 28, from paralysis, after a short illness.

**William H. Fesker, M.D.** Medical College of Ohio, Cincinnati, 1900, died at his home in New Bremen, Ohio, June 5, from rheumatism of the heart.

**James S. Hottel, M.D.** University of Virginia, Charlottesville, 1896, died at Conierville, Shenandoah County, Va., June 3, from typhoid fever, aged 32.

**William A. O'Bryan, M.D.** Kentucky School of Medicine, Louisville, 1868, died at his home in Kansas City, Mo., May 28, from pneumonia, aged 59.

**Samuel R. S. Smith, M.D.** Jefferson Medical College, about 1850, died at his home in Ardmore, Pa., from pneumonia, after a short illness, aged 80.

**A. L. Elder, M.D.** Cincinnati College of Medicine and Surgery, 1875, died at his residence in Hebron, Neb., June 5, after a lingering illness.

## State Boards of Registration.

The Indiana Board has notified eight persons who are practicing medicine at South Bend and New Carlisle in St. Joseph County, of their failure to comply with the law in that they have not filed their certificates with the county clerk. Five others are practicing without certificates and have been ordered to cease. The board will prosecute the violators if its instructions are not obeyed. There seems to be activity along this line in a number of states.

**Milwaukee Medical College Matter.**—The investigation of this college by the Wisconsin Board of Medical Examiners has been completed. The faculty were summoned before the board to defend the college against the charges, which included the following: That the college received insufficiently-prepared applicants to advanced standing, that diplomas were given to persons deficient in training, and that students were authorized to practice independently before the completion of their college course. The investigation has occupied many weeks. The charges were preferred by the Milwaukee County Medical Society. The report is as follows:

We find that the Milwaukee Medical College is a living enterprise and institution of learning which Milwaukee and the state of Wisconsin should be proud of and take pride in its welfare, if properly conducted.

Second. We find that some of the charges of irregularity that have been brought against the Milwaukee Medical College are based on facts though not necessarily committed with any intention of evading the law.

Third. We find that certain discrepancies in the manner of graduating the students from the college, brought out by the investigation, are not in themselves a sufficient evidence of a habitual and intentional disobedience of medical laws, although they are subject to criticism.

Fourth. We find further from the evidence brought out during the investigation that the charges are overdrawn and though not wholly disproven are of such a nature that some must be considered conjectural.

Fifth. We find that these charges are considered timely and justifiable in an attempt to abrogate or improve existing conditions in college.

Sixth. This board will insist in the future that those in control of the college shall strictly conform to the rules and the letter of the law.

The Oregon Board, at Portland, April 5, gave 34 applicants a written examination on 9 subjects, with 90 questions, and found 31 able to attain a grade of 75 per cent. The other 3 could not receive license to practice medicine in Oregon. The list follows:

| Sch. of<br>Pract. | PASSED.                                |       | Year.<br>Grad. | Per-<br>cent. |
|-------------------|--|-------|----------------|---------------|

**Idaho Practice Law Constitutional.**—Dr. L. F. Inman of Lewiston, who had been refused a license by the Idaho State Board of Medical Examiners on the presentation of a diploma from the notorious Chicago fraud, the Independent Medical College, was arrested for practicing medicine without a license and convicted. He sought release from the sheriff's custody by a writ of habeas corpus from the District Court. This was refused and he tried the Supreme Court and was again refused. The decision is at length, and affirms the validity of the medical practice law of Idaho. Extracts are as follows: We find nothing in this act which attempts to deprive anyone of a vested right. It is true that persons who are actually engaged in the practice of medicine or surgery under the laws of 1887, and persons who had acquired a license from the board, under the defunct act of 1897, are not required to undergo an examination before the board of examiners under the act in question; and it is also true that such persons are only required to pay to the board a fee of \$5, while all other persons, required to take an examination, are required to pay a fee of \$25. These provisions are not, in our opinion, open to the objection of "class legislation," or "special immunities." The act makes certain evidence prima facie sufficient to admit the applicant to license and to continue the practice of medicine and surgery, or either, without examination. This provision, and the provision requiring that the fee of \$5 should be paid applies to all persons who stand in the same position, that is, those who under the act need not take the examination. It is not an unreasonable requirement, nor class legislation, to require that those applicants who do not possess the prima facie evidence required by the statute to entitle them to license without examination, to pay to the board of examiners a fee of \$25. It is argued on behalf of the petitioner, too, that no one, under the provisions of the act in question, can take the examination and acquire license who is not a graduate of a reputable college of medicine in good standing; and that the board is made the judge of what is a reputable school of medicine, and therefore vested with judicial power, in contravention of the provisions of our constitution. We think that the provisions complained of are reasonable and the proper exercise of the police power of the state. Similar legislative acts have so often been held to be a proper exercise of the police power of the state as to make citation of authority

upon that question almost unnecessary. It has often been held that it is competent for the legislature to provide for a board who shall pass upon the competency of applicants to practice medicine and surgery. The vesting of such power in the board does not grant to it such judicial power as renders the act objectionable under the provisions of Section 2 of Article V of our constitution. A careful perusal of the act in question, and of all its parts, shows a carefully guarded intent on the part of the framers of the act, and on the part of the legislature in enacting it, to protect the health and lives of the inhabitants of the state; to prevent incompetent persons from practicing medicine and surgery; and at the same time, to work no injustice upon the part of applicants for license, recognizing the rights of the old practitioners, under the act of 1887, who were not graduates of any medical school, recognizing the rights of those who, under said act, had diplomas from medical schools, and who were actually engaged in the practice of medicine at the time of the passage of the act in question; and by providing in express terms for a review, by the courts, of the action of the State Medical Board in all cases in which they should refuse an applicant a license. Under the provisions of said act, all applicants must be persons of good moral character, free from criminal practices, and that they should not be convicted criminals; a wise, humane, proper and legitimate exercise of the police power of the state.

The Missouri Board, on April 2, at Kansas City, and on April 15 and May 8 at St. Louis, examined 221 applicants for license, of whom 118 passed 75 per cent. and 103 failed. The non-graduates numbered 97, of whom 24 passed and 73 failed. We tabulate the graduates below:

## Book Notices.

THE SYSTEM OF PHYSIOLOGIC THERAPEUTICS, A Series of Eleven Volumes. Vol. I.—Electrotherapy—Apparatus and Method of Handling. Edited by George W. Jacoby, M.D., New York. Pp. 242. 163 Illustrations. Vol. II.—Electrotherapeutics. Edited by George W. Jacoby, M.D. Pp. 323. 217 Illustrations. Vol. III.—Climatology and Health Resorts. Edited by P. Parkes Weber, A.M., M.D., F.R.C.P. (London), and Guy Hinsdale, A.M., M.D., Philadelphia. Colored Maps. Pp. 336. Vol. IV.—Health Resorts. Edited by P. Parkes Weber, M.D., and Guy Hinsdale, A.M., M.D. Pp. 420. Vol. VI.—Dietotherapy and Dietetics. Edited by N. S. Davis, Jr., A.M., M.D. Pp. 420. Cloth. Price, \$22.00 net. Under the General Editorial Charge of S. Solis-Cohen, A.M., M.D., Philadelphia: P. Blakiston's Son & Co.

The forementioned volumes being those of the eleven which have been issued, are unique in their method of presenting the different subjects. The first and second volumes deal with the physics and therapeutics of the different forms of current and with electro-diagnosis. The second volume, thoroughly illustrated, contains interesting articles from such experienced men as Drs. Da Costa, Jackson, Scheppegegrell, Martin and Ohmann-Dumesnil. The third and fourth volumes are devoted to climatology and health resorts. The first part of Vol. III treats of the factors of climate, and the second part describes health resorts and mineral springs and in this connection discusses the climatic treatment of various diseases. Volume IV also contains a special article on the Hawaiian Islands by Dr. Titus Munson Coan of New York. Volume VI, which should be in the hands of every general practitioner, is devoted to alimentary therapeutics and dietetics. This volume certainly fills a vacancy in the field of therapeutics. The various diseases are taken up in their order, and the articles of diet best suited for the patient in the different stages of the disease, are mentioned. This volume also contains tables of dietary and relative values of foods.

MENTAL GROWTH AND CONTROL. By Nathan Oppenheim, M.D. Cloth. Pp. 295. Price, \$1.00. New York: The Macmillan Co. 1902.

This is a little work on what might be called practical psychology, teaching young men and women how to educate their mental faculties, and, so far as we can see, the work is one that can be endorsed—with possibly one exception. The author's recommendations in regard to religious matters might be open to the same objection of insincerity which he makes himself. The average sincere religionist would not accept his idea that there is little difference between one religion and another, the whole thing being simply what he calls being religious, though there is a good deal of psychologic truth in the statement that if we cultivate all the emotions, and live the life of a believer, actual belief will come, as was pointed out long ago by Pascal and many others. Still one should have convictions, and they are really the things that make any religion respectable, though they need not be incompatible with tolerance. Aside from this possible criticism we can see nothing in the book which ought not to be endorsed, and we can cordially recommend it to the average young man and woman.

THE DIAGNOSIS OF SURGICAL DISEASES. By Dr. E. Albert, Late Director and Professor of the First Surgical Clinic at the University of Vienna. Authorized Translation from the Eighth Enlarged and Revised Edition, by Robert T. Frank, A.M., M.D., with 53 Illustrations. Cloth. Pp. 419. Price, \$5.00. New York: D. Appleton & Co. 1902.

As the translator says, works on surgical diagnosis are comparatively few in the reach of American readers, hence he has rendered a service in translating this eighth enlarged and revised edition of Albert's work. The publishers have brought out the volume in excellent shape, and we believe it will be considered a valuable contribution to our medical literature.

## Miscellany.

**Longevity and the Physician.**—The mortuary statistics of life insurance companies place physicians low on the list as regards longevity. There are perhaps many reasons why this should be so, since the arduous nature of his calling is generally acknowledged. Beside the physical work and under many circumstances this is excessive, there is a burden of responsibility and a wear and tear on the sensibilities that undoubtedly tends in certain susceptible organizations to an early break-down and, unfortunately, in not a few instances leads its votaries to resort to stimulants or narcotics. In men who have passed the meridian of life, the irregularities and harassments of a general practice, added to the unnatural stimulus of sharp competition (for many middle-aged physicians are as jealous of their clientele as though they were beginners), must necessarily do something to shorten the latter years of life, as they certainly destroy its comforts and leisure. Still, the medical profession has had and has now, many conspicuous examples of longevity, which will readily occur to the reader. It would seem that foreign medical men more frequently reach the age limit than do Americans, which only indicates that we suffer from the prevailing national vice of leading too strenuous an existence. The oldest practicing physician in the United States is said to be Dr. O. R. Skinner, of Freehold, N. J., who is in his 93d year. He was a surgeon in the Civil war. He is kept busy with his professional duties and answers promptly all calls. His long life is probably due in part to the fact that most of it was passed prior to the general use of the telephone.—*Carolina Med. Jour.*

**The Effects of Alcoholic Stimulants.**—Kidney and liver diseases, with their consequent heart failure and arterial degeneration, are so common that it behooves the physician to carefully inquire into the habits of patients and of those examined for insurance. An applicant will always minimize the amount of alcohol consumed, says the *Medical Examiner and Practitioner*. The steady drinker is a more dangerous life risk than the occasional one who gets drunk. The constant presence in the blood of the deleterious products produced by alcohol will ultimately lead to degenerative changes in the vascular apparatus, and connective changes are sure to follow. Examiners can, by tact, frequently arrive at a proper judgment of the habits of an applicant, and at the time of the examination observe the force and volume of the pulse. They can also ascertain its tension, and thus be able to judge of the condition of the arterial changes. Then, again, by carefully examining the heart sounds, as to regularity, rhythm, accentuation and rapid-

ity, they can form a fair idea as to its condition. By carefully mapping out the cardiac area they can gather whether or not it is enlarged, and if so, the direction in which the enlargement extends. By carefully comparing this data with the habits of the applicant, often a judgment can be reached which will enable the examiner to say whether or not any cardiac changes have taken place. One of the most dangerous cardiac changes, which is sometimes present but often overlooked by the hurried and careless examiner, is a fatty degenerated heart with dilatation. This condition is sometimes present in those individuals who combine over-indulgence in alcoholic stimulants with extreme physical exertion; the athletic heart of the middle-aged person. These are dangerous cases for the life insurance company.

**Early Medicine in Maryland, 1636-1671.**—Light has been thrown upon this period by Dr. Walter R. Steiner, in a recent paper read before the Johns Hopkins Historical Club. There is no reference to priest physicians, so numerous in New England. Medicine was learned in apprenticeships of three to seven years. Doctors were styled "physicians and surgeons." Some are spoken of as "barber surgeons." One, George Binx by name, is entitled "Licentiate in Physicke." Eight served as "burgesses" in the Assembly. Among these, Dr. Thomas Gerard, who came over in 1638, was most prominent. He was elected to it in 1639, and served almost continuously until named as one of the Council in 1643. In 1640 he was made Lord of St. Clement's Manor in St. Mary's county, where he presided over a sort of independent ("leet and baron") court. He was a devout catholic and incurred the displeasure of the protestants by interfering with their worship. The Assembly was held at his house for some weeks in 1660. At first he was true to Lord Baltimore, but later fell away and was found guilty of treason, although subsequently pardoned. On one occasion, when on trial for certain alleged misconduct, a witness testified that he "had drunk something extraordinary, but was not so much in drinke but he could gett out of a cart's way." He probably early gave up practice to devote himself to his public duties. He was a man of wealth and was always assessed more than any other doctor. His name appears frequently in the court records as suing and being sued or as acting as jurymen, administrator or attorney.

Another physician prominent in public life was Dr. Luke Barber, who was mediator between the Royalists and Puritans and was taken prisoner at the battle of Providence (Annapolis) March 23, 1655. Lord Baltimore granted him 1,000 acres at Porttobacco on account of his services. He was also Lieutenant-Governor and member of the Governor's Council.

Richard Purlivant, assemblyman, received land "for having transported himself at his own charge into the Province" and "having practiced his art to the benefit of the inhabitants of our Isle of Kent." John Robinson, assemblyman, was apprehended for debt. Alexander Pulton, or Putton, assemblyman, in 1642, received 150 pounds of tobacco "as surgeon's pay in the late expedition." Suits were frequent in those days for tobacco and corn due for medical and surgical attendance and physic. "Breathing a vein" was an item in the bills. There is a record of a suit brought by Peter Sharp against Peter Godson, both physicians. This Peter Godson and his wife seemed to be continually in hot water.

Although there were no women doctors then, one woman, Katherine Hebdlen, wife of Thomas Hebdlen, a practitioner of medicine, gave physic to Richard Lawrence and was paid therefor 1,900 pounds of tobacco by the sheriff by order of the court. It is recorded also that she "did chirurgery upon the legg of John Greenwell, the man servant of Edw. Hall."

Among drugs used was "Mithradate," a panacea, which recalls the famous antidote of King Mithridates.

Jacob Lambrozo, a Jewish physician from Lisbon, Portugal, arrived in Maryland in 1656 and settled in Charles county, where he enjoyed a lucrative practice. About two years later he was accused of blasphemy, but escaped trial through the general amnesty granted at the succession of Richard Cromwell. He died in 1666.

Witchcraft obtained but slight hold in the province, but one execution taking place in 1684.

Obstetrics was in the hands of midwives, several of whom are mentioned by name.

Juries of women were impaneled from time to time to report

on the condition of members of their sex suspected to be pregnant or to have destroyed their infants. Such are recorded in 1656 and 1657.

Inquests were held early and the causes of death diligently searched into. On Jan. 31, 1637, twelve planters held inquest on a man killed by the fall of a tree, their verdict being that the tree should be forfeited to the Lord Proprietor. On March 23 and 24, of the same year, inquests are held on the bodies of two men drowned. Again in 1642 there is an inquest on an infant, and in 1643 a very striking one, signed by George Binx, foreman, in which a very complete examination was made of the abdomen of an Indian who had been shot. The George Binx, Licentiate of Physicke, mentioned above. In 1657 two surgeons, Mr. Richard Maddokes and Mr. Emperor Smith, performed an autopsy upon the body of a man killed by his master, and received a hog-head of tobacco, to be divided equally between them. In 1648 an autopsy was made on a man who was "found dead upon the sands of Poynt Looke out in St. Michael's Manor," with evidences of foul play. On July 20, 1670, John Stansley and John Peerce, surgeons, were ordered to view the head of Benjamin Price, and "certify what their opinions are touching the death of the said Price," who was thought to have been killed by the Indians. By an act of the Assembly of 1671 the coroner's fee for an autopsy was fixed at 250 pounds of tobacco.

The above records seem to show that the early Maryland doctors were men well abreast of their times and who served well their day and generation. Dr. Steiner's paper, which is based upon the Maryland archives (published recently by the state), will appear in full in the *Johns Hopkins Bulletin*. It is one of the most important contributions to the medical history of the state.

## Association News.

### AMERICAN MEDICAL ASSOCIATION.

Fifty-third Annual Meeting, held at Saratoga Springs, N. Y., June 10-13, 1902.

### GENERAL MEETING.

#### Official Minutes.

#### TUESDAY, JUNE 10—FIRST GENERAL MEETING.

The Association met in Convention Hall, and was called to order at 11:15 a. m., by the President, Dr. John A. Wyeth of New York.

Prayer was offered by Rev. T. F. Chambers of Saratoga Springs, after which Dr. George F. Comstock of Saratoga Springs was introduced and read his report as Chairman of the Local Committee of Arrangements.

#### Report of the Committee of Arrangements.

*Mr. President, Ladies and Gentlemen and Members of the American Medical Association:* The Committee of Arrangements acknowledges the honor that was conferred on this village in its selection as the place of meeting for this annual session of the American Medical Association, and greets you with a program of entertainment that we hope will be carried out to your satisfaction.

Knowing fully that the material resources to be found in a large city, such as where the meetings have usually been held, were not to be had in a small community like Saratoga Springs, it was a satisfaction to know that the invitation was in a large measure considered as from the New York State Medical Association, and it is with great pleasure that we acknowledge the helpful support of the officers and members of that affiliated body, in the discharge of the duties that were placed upon us as a committee.

In some respects, the committee has found its problems made less difficult than those that might arise in other places, and in particular, that "magnificent distances" do not separate the places of meeting.

It is with regret, however, that just at the time of meeting, some places that had been secured for section meetings ceased to be available, and hence a few changes were necessitated. This was the case in the Section on Physiology and Pathology, which has been changed from the Grand Union Club room to a room accessory to the Congress Hall ballroom, and the Section on Stomatology, from G. A. R. Hall to the Grand Union Club room (upstairs). The pocket-card directory found

in your envelopes was issued before these changes were made, but a revised edition has been printed on pink paper, and that should be regarded as official, although, after the printing of this second card, only yesterday, fire rendered further changes necessary, and the House of Delegates is moved to a room upstairs in the Town Hall, known as the Hibernian Room, and the gynecologic loses its proximity to the Surgical Section, in being necessarily moved to the Town Hall Auditorium.

The visiting ladies are invited to meet the local ladies' committee at an informal reception in the parlors of the United States Hotel, this afternoon, at 4 o'clock, when acquaintances may be made and information imparted.

The program for entertainment is as follows:

On Tuesday evening, at 8:30, there will be a piazza concert at the United States Hotel, at which will be given both vocal and instrumental selections.

On Wednesday, at 9:30 a. m., there will be an instrumental concert in Congress Spring Park, and at 1:30 p. m. there will begin a carriage drive around the village for the visiting ladies, starting from the United States Hotel and including a visit to "Yaddo," from 5 to 7 p. m., on the invitation of Mr. and Mrs. Spencer Trask. In this invitation to "Yaddo" the physicians are specially included. It is feared that a sufficient number of vehicles is not available to carry them as well as the ladies, but as it is not a long walk out Union Avenue, one of the pleasantest streets of the village, it is hoped that many of the gentlemen will go for the exercise, and the pleasure of a visit to this beautiful home.

On Wednesday evening, at 9 o'clock, the management of the United States Hotel will give a reception and ball in honor of the Association.

On Thursday an excursion to and through Lake George will leave on the Delaware & Hudson railroad at 8:30 a. m., returning in ample time for dinner.

The final entertainment will be the reception given by the New York State Medical Association to the President of the American Medical Association in the United States Hotel at 9 p. m., Thursday.

With the exception of the visit to "Yaddo," the reception and ball by the United States Hotel, and the reception to the President, these entertainments are for the visiting ladies only.

The committee wishes earnestly to impress on the members and the visiting ladies the importance of wearing the badges that have been provided, particularly in connection with these entertainments.

The arrangements and places for the Section dinners will be announced at the Section meetings this afternoon.

The Transportation Committee will be found, during business hours, at 361 Broadway, under the American-Adelphi Hotel, where arrangements for return tickets are to be made.

Dr. H. L. E. Johnson, of the District of Columbia, presents this flag to the American Medical Association and begs that they accept it. The Board of Trustees recommend that it be adopted by the Association as their colors and that it fly at all meetings of the Association.

Elaborate preparations have been made for a Canadian and New England excursion, which will leave Friday morning at 8:30, going through Lake George or, if preferred, at 10 a. m., connecting at Fort Ticonderoga, omitting the excursion through Lake George.

If the party is sufficiently large it would be feasible to have it divided, one-half leaving on Friday morning and the other half on Saturday morning and joining at Montreal. A large number have already registered for this excursion, and a most enjoyable trip is anticipated by the promoters of the same. All those desiring to indulge in this most delightful trip through Canada and New England should register with the chairman of the Transportation Committee at the Adirondack Spring Parlor before 8:30 a. m. Thursday.

#### Presentation of Flag.

Dr. H. L. E. Johnson, of Washington, D.C., presented a large and beautiful banner to the Association.

The President, on behalf of the Association, said he felt empowered to express to Dr. Johnson the thanks of the members for the donation of this flag, and expressed the hope that it would be the flag of the Association for many, many years to come.

President Wyeth then introduced the Hon. S. F. Nixon, Speaker of the New York State Assembly, as "the friend of organized and scientific medicine in the Empire State; a man who has never turned his back upon any measure we have brought before the legislature." [Applause.]

Mr. Nixon was warmly received. He delivered the following address of welcome.

#### Address of Welcome.

*Mr. President, Ladies and Gentlemen:* I am never introduced to an assemblage, the majority of whom reside outside of the limits of the State of New York, as the presiding officer of the lower body of the Legislature but there comes to my mind a little incident which occurred in the city of Washington during the time when the Hon. Thomas B. Reed was Speaker of the House of Representatives, and during those times when speakers not only at Washington, but in some of the civil divisions of the United States were subjected to criticism, so I feel, as a matter of fairness to myself, that I am entitled to relate it.

A father sat with his little son in the gallery of the House of Representatives, and during the time of a heated debate the little fellow leaned over the gallery side and said to his father: "Papa, who are those gentlemen that I see down on the floor below?" And he said: "My son, those are the speakers of the House of Representatives." And still he looked at them for a moment or so, and finally observing a stolid gentleman who sat on the rostrum, he said: "Papa, who is that gentleman sitting on the rostrum with a gavel in his hand?" He said: "My son, he is the House of Representatives." [Laughter.]

After some of the things with which the delegates from this state are familiar as having occurred at Albany during years past, I desire to say I accept only individual responsibility rather than responsibility for all of the members of the Legislature. [Laughter.]

I assure you I appreciate the honor done me, when my friend, Dr. Ferguson, was deputized to invite me to welcome this great assemblage on behalf of the State of New York, and I promise you, on behalf of this commonwealth, that no matter where your convention may be held, whether in the East, in the West, in the North or in the South, you will not meet with a higher degree of appreciation than by the people of this state. [Applause.] It occurred to me that there might be a tinge of professional courtesy in connection with that invitation. The analogy came to my mind that the Legislature occupies the same position towards the body politic that the physician does toward the body physical. True it is, you elect yourselves and are subjected only to the will of Providence, while we are elected annually or biennially and are subjected to the will of the people. You never make a mistake in diagnosing a case; but if we make a mistake and diagnose some public demand contrary to the judgment and desires of the divisions which we represent, we are retired to the political convalescent ward, and from that ward many states will never return. [Laughter and applause.]

It is unnecessary for me to state that the State of New York is glad to have your convention within its borders. We are glad to have you conduct your deliberations here, because we believe your convention here will be productive of possibly more good than in any other locality in the United States.

New York has always been in favor of the elevation of the standard of education. We are in absolute sympathy with the principles upon which and for which your Association was organized. I believe it was in a New York State medical convention in 1844 or 1846 that the idea of a National Association first had its inception. [Applause.] You are organized for the better education of medical students, not alone from the standpoint of medicine, but you are organized for the purpose of having them acquire a better preliminary education. Your Association was organized at a time when those colleges which would give degrees for the least expenditure of time and money were receiving the patronage of all classes of students who were endeavoring to acquire a professional education, and it is due to your Association, which I believe became permanent in 1847, that this standard has been elevated, and that you have to-day placed the medical colleges of the United States upon a plane equal, if not superior, to those of the old world. [Applause.] I believe that without any criticism or egotism I can say that the State of New York is and has been foremost in educational work of any state in the Union, and we are endeavoring from a legislative standpoint, with the hearty co-operation of the several divisions of this state, to have our standard of education as near ideal as possible. New York State, early in her history, established a common school system, which has become the fundamental basis of the educational system of all our states. We established first free public libraries, we built and maintained the first normal school for the training of teachers, and teachers trained in our normal schools can be found throughout the length and breadth of the civilized world. We established the first system for the supervision of schools; in fact, inso-

far as educational matters are concerned, New York State has always forged to the front and has always endeavored to reach as near the goal of perfection as possible. New York State has always endeavored to increase the standard of the preliminary education of medical students, and to-day seventy-nine of the eighty medical colleges of the United States accept a medical student from New York State who has a certificate for admission at its full faced value. While it is impossible to prescribe any well-regulated rules for admission to the medical profession, owing to the varied conditions of population, of general development and of education, yet, it seems to me, it would seem that instead of having one standard for each of our states, we might have several standards that would answer for all. It would seem that similarity of conditions in various states can be so grouped that there would be only a small number of standards instead of, I believe, forty-five for admission to the practice of medicine. [Applause.] While I appreciate it is not within the province of the state to interfere with the well-regulated springs of the profession, yet it occurs to me that one of the principal and most important functions is to place the standard of requirement, so far as our professions are concerned, absolutely the highest. [Applause.] We are called upon to regulate many matters by legal enactment.

You will recall that in Biblical history it is said of one of the ancient kings, I believe Asa, when he was sick betook himself unto the Lord and not unto his physician, and he rests with his fathers. [Laughter.] I understand that there are those within recent times who have followed the example of Asa, and rumor states to me with the same result. [Laughter.]

The nineteenth century represents practically the climax of achievement. Within each decade inventions and developments have come to us which, when considered individually, are marvelous from a mechanical and commercial standpoint. The material condition of things has been absolutely changed. The locomotive and the steamboat were the forerunners of business advancement; the telephone and the telegraph were found necessary for the transaction of the large volumes of business which we to-day enjoy. But the advancement in the mechanical world does not mark any greater strides of development than those which have come to us within the same length from the medical world. [Applause.] What steam and electricity have done for commercial development, the discovery of anesthetics and antiseptics has done for the medical world, and the grand achievements of this profession during the past fifty years have been fully abreast and in keeping with the advancement of all material things. The opportunity for advancement in the medical world has been due very largely to the munificent gifts of some of our men of wealth, who, following the example of John Harvard, have endowed medical colleges and hospitals throughout the United States [applause] until, I understand, to-day the opportunity for a finished medical education is equally as good in the United States as it is in the old world.

When we come to consider the conditions of to-day as compared with those of the early days, it seems almost like a marvel. When we come to consider the improvements which have come to us, during the past fifty years, we wonder what is in store for the genius of the twentieth century. You will recall, possibly, a little incident that was directed to my attention a short time ago. A student in a medical college in connection with Bowdoin University went into the anatomical laboratory one day and met one of the professors. He was studying anatomy, and he desired to impress upon the mind of his preceptor his desire to become extremely advanced, and so he said to the professor: "Is there not some new book upon anatomy that we have not got in our library?" And the old gentleman turned to him and said: "Young man, I don't know of a single new bone in the human body that has been discovered during the past ten years." [Laughter.]

There is no doubt but that some of the opportunities which existed in the early days of the nineteenth century exist to-day in the advancement of science. We as a nation to-day occupy a proud position, and have ever occupied such a position from the day of our inception. We have accomplished during the past six or seven years such brilliant achievements that we are the wonder and admiration of the civilized world. [Applause.]

I remember hearing a toast which was offered some time ago by an American who sat at a table in London with some of his English friends, and the first suggestion was from an Englishman, who said: "I desire to propose a toast to that country upon which the sun never sets." An American resident said: "I desire to propose a toast to that nation which is bounded on the north by British America, on the south by the Gulf of Mexico, on the east by the Atlantic, and on the west by the

Pacific ocean." And then another Englishman, a little more enthusiastic than the former, said: "I desire to propose a toast to that nation whose campfires, when lighted at night, are the beacon lights through the length and breadth of the civilized world." Another American said: "I desire to propose a toast to that country which is bounded on the north by the north pole, on the south by the south pole, on the east by the rising and on the west by the setting sun." [Applause.] Finally, a little fellow who had not entered very much into the spirit of the affair, said: "While I agree with all of the suggestions made by my American friends, I desire to propose a toast to that nation which is bounded on the north by the aurora borealis, bounded on the south by the position of the equinox, bounded on the east by primeval chaos, and bounded on the west by the day of judgment." [Laughter and applause.]

With this expanse of territory which has come to us, with the accumulated advantages of the past century, what will it not be possible for American pluck and American genius to accomplish?

I appreciate that I am encroaching somewhat upon the time of my friend who sits behind me. I wish that I might give to you a welcome upon the part of the state that you can construe as literally as you can his welcome to this beautiful village of Saratoga. I can only give that which I have, and I simply represent a very small part of the state. But the terms Brackett and Saratoga for a number of years have been synonymous, and I wish to say to you confidentially, that the good things which he offers to you you can take absolutely literally, because they're his.

I desire, again, on behalf of the people of this great commonwealth, to welcome this Association to the State of New York, and I trust that the few days you will remain with us may be fraught with both pleasure and profit. [Applause.]

The President then introduced Senator Edgar T. Brackett, of Saratoga, who delivered an address of welcome on behalf of the citizens of Saratoga Springs.

#### Address of Welcome by Senator Brackett.

*Mr. President and Members of the American Medical Association:* You have been welcomed to New York State by the distinguished speaker of our State Assembly. It is my pleasing duty to welcome you to a more circumscribed locality, the village of Saratoga Springs. When I was selected to welcome this body on behalf of the village of Saratoga Springs, I gave earnest thought to the matter, and I say to you in confidence, that I recognized the faces of many of you whose acquaintance I made in the city of Albany. I say to you in confidence, which I hope you won't repeat, that the only reason which has occurred to me in considering your invitation is that I was selected last winter after having been buncoed by the Osteopath bill. [Laughter.]

Saratoga Springs is the greatest health-giving resort on the continent, and I extend to you the warmest reception as the healers of this western hemisphere. If I were disposed to stand here and advertise Saratoga and its products I could give a multitude of reasons why you should meet here. But becoming modesty forbids me to say more than that you have chosen this place for your meeting in the month of June, which is a compliment. It is a place which, for more than a hundred years, has been the resort of the health-seeker and of the recreation seeker. It is known that the original inhabitants came here recognizing that it was a place where they could cure their ills. You will find here mineral springs such as do not exist elsewhere on the globe. We have saline springs, alkaline springs, iron springs, sulphur springs, etc., and our water is good for any condition of the stomach, the bowels or kidneys. [Laughter.]

Such a place as this cannot fail to be interesting to the physician, and such it has always been, and it is to this place to which I am deputed to welcome you, which I do most heartily.

Measuring the life of your profession it is but a short period from the time of Valentine Mott to the year 1902, and yet in the thirty-seven years that have passed since Mott joined the silent majority greater results from the standpoint of a layman and one outside of the profession have been accomplished than were brought about in the twenty-two hundred and fifty odd years previous, dating from Hippocrates. If the question was asked a student in what age he would prefer to have lived, I can see embarrassment on his part in the answer. One would say in the age that saw Washington and the birth of the Republic. Another would say the age that gave us Lincoln and the new birth of freedom; a third would find his choice in the age of McKinley for its magnificent strides of progress. [Applause.] If the question was asked of a member

of my own profession I can readily see there would be reasons for diverse conclusions, and one might say in the age of the great Mansfield, who developed the commercial law of England, which remains to-day practically the same as when it left his formative hand. Another would find his choice perhaps in the age when John Marshall reigned in our Supreme Court; still another would find a choice in the age of Everett and Carpenter, and each would have reason for his choice. But I cannot imagine, Mr. President, a question put to a member of the medical profession which would permit of any other answer than that it is a joy to live in the age that saw Lister and Pasteur, and the later work of our own great Marion Sims. [Applause.] When history shall come to record her impartial account of the doings of your profession, as she writes of Harvey, there will be put beside his name, "Well Done." As she recounts the doings and achievements of Jenner, she will add "with praise." When she comes to put on the page an account of anesthesia and the painlessness of operations she will add the words, "Cum Magna Laude," which are dear to every scholar's heart.

It was the opinion of some one—I can not give his name, but I think it was a German scientist—who said that disease was created virtually for the purpose of giving the physician training and development, and that it was the duty of us weak mortals to suffer in order that your profession might attain its ripest fruit. Mr. President, I can not agree with the ultimate conclusion of that learned member of your profession.

I cannot refrain from saying, in closing this address of welcome, that the world recognizes the high character of your work; it recognizes your achievements, and you have the thanks and gratitude of the sick world. [Applause.]

#### President's Address.

At this juncture Dr. Alonzo Garcelon of Maine, the first vice-president, took the chair, and President Wyeth delivered his address.

#### Oration on Surgery.

Tuesday evening, at 7:30 p. m., Dr. Harry M. Sherman of California was introduced and delivered the Oration on Surgery.

*(General Meetings continued on page 1662.)*

### PROCEEDINGS OF THE HOUSE OF DELEGATES.

TUESDAY, JUNE 10—FIRST SESSION.

The House of Delegates convened in the Children's Dining Room of the United States Hotel, and was called to order by the President, Dr. John A. Wyeth, of New York, at 3 p. m.

The Secretary called the roll of registered delegates, 92 being present.

#### Business Committee Appointed.

The President suggested, for the purpose of more perfect organization, and in order that business might be transacted promptly and expeditiously, the appointment of a committee to which resolutions on new business could be referred, and then subsequently reported back to the House of Delegates by this committee for final disposition.

Dr. J. N. MacCormack, Kentucky, accordingly offered a resolution, which, after being discussed by Drs. Reed, Moyer, Ferguson, Bishop and McMurtry, was amended by Drs. Moyer and Bishop, and the resolution as amended and adopted is as follows:

*Resolved*, That a Business Committee be appointed, consisting of five members, who shall be in continuous session in the House of Delegates during its sessions, and to whom shall be referred all resolutions, after being read, on new business. The Business Committee shall report, with recommendations, as soon as practicable, on all resolutions so referred, and may be discharged from the consideration of any resolution by a majority vote of the House of Delegates. This committee shall be asked, if they wish, to make a report before a motion to adjourn is put.

The President appointed as a business committee Drs. J. N. MacCormack, chairman, Kentucky; P. Maxwell Foshay, Ohio; Harold N. Moyer, Section on Nervous and Mental Diseases; E. D. Ferguson, New York; and T. J. Murray, Montana.

The President then delivered a brief address. Among other things, he spoke of the critical period through which the Association is now passing because of the change of organization, and of the fact that after fifty-three years of trial the original plan had not secured that concert of action in the entire profession which had been hoped for. As a result there had been accepted one year ago the plan of the Committee on Organization, and the testing of it by experience at the present meeting. Forbearance and charity are therefore required of all toward

those who differ, in order to bring about the union desired by all. He advised the appointment of a Committee on Sections and Section Work, composed of members of the House who have had experience as chairmen of Sections, the chief duty of such committeemen being to advise or aid the inexperienced chairmen-elect of each Section in the organization of that Section, the arrangement of the material, program, etc.

The need of interstate comity, or reciprocity, he said, requires the attention of the delegates, and the plan of Dr. W. L. Rodman was spoken of as "worthy of careful consideration."

As to the management of the annual meetings, and the payment of expenses, it was recommended that the House of Delegates, with the Secretary acting as its agent, hereafter assume the responsibility and management of the annual meetings.

The retention of the national committee of three on medical legislation was advised as a part of the Committee on Medical Legislation.

The establishing of a Department of Public Health at Washington was held to be one of the duties incumbent upon the Association, and the necessity of the continuance of the Committee on National Legislation was emphasized, as well as our common duty to impress on the community in which we reside the necessity for and the safety of the immunizing process of vaccination.

The appointment of an officer who shall act as a national organizer of the profession was earnestly recommended, one who, specially fitted for such work, would add largely to the membership of the Association by visiting those states or territories where, as yet, medical organization and society work are practically neglected.

On motion of Dr. H. Bert Ellis, California, the address was referred to the Business Committee.

The Secretary presented his report.

#### Report of the Secretary.

*To the House of Delegates of the American Medical Association—GENTLEMEN:*

#### STATE SOCIETIES AND REORGANIZATION.

Agreeable to instructions contained in a resolution adopted at the last meeting of this Association, I have been in correspondence, during the past year, with the officers and members of each of the state and territorial societies in affiliation with this Association, in regard to a uniform and more systematic organization of the profession of the whole country.

In my correspondence, I dwelt on the necessity of the changes recommended by the American Medical Association and asked each society to take up the matter at its next meeting. Almost without exception, the state and territorial societies, through their officers, have shown not only a willingness but an earnest desire to co-operate with the American Medical Association in this work of reorganization.

As correspondence progressed it soon became evident that the various state societies, or the committees representing them, while anxious to conform to the recommendations of the American Medical Association, were at a loss to know how to arrange their constitution and by-laws so as to incorporate the principles recommended, and many of the members of these committees wrote me asking if the American Medical Association could not suggest a form that could be adopted by all state societies that desired to do so.

On investigating the matter, I found that the Committee on Reorganization, in its report at St. Paul, recommended that a small committee be appointed to co-operate with the state societies in this work, and that, while this recommendation had been adopted, no action had been taken on this point specifically, and no committee appointed. I, therefore, called Dr. Wyeth's attention to this matter, and he appointed as the committee to formulate a constitution and by-laws for state societies the original Committee on Reorganization, viz., Dr. J. N. MacCormack, Dr. P. Maxwell Foshay and Dr. George H. Simmons. This committee will, I presume, report to you direct.

Several of the state societies have adopted this constitution and by laws, some with slight modification and others exactly as submitted by the committee, except verbal changes. Among these are Kentucky, Missouri, Ohio and Tennessee. California has adopted the general principles, as well as much of the wording of our Constitution and By-Laws; Illinois adopted a new constitution and by-laws prepared by its own committee. This adopts nearly all of the principles recommended by the American Medical Association. But few of the state societies appointed committees last year so they were not able to take final action in changing their constitution and by-laws. All

in the states thus far heard from have appointed committees on organization so that we may expect next year to see most of the state societies falling in line.

This work of organization, permit me to say, is only just begun, and it devolves upon this Association to keep up its work of stimulating the state societies so that these bodies may stimulate organization in the counties. It is only through a centralized effort that the work can be accomplished. The beginning thus far made, and the unanimity with which all the state and territorial bodies agree to co-operate should stimulate the American Medical Association to every effort possible, so that the much-desired organization of the profession of the whole country may be accomplished within a very short time.

#### MEMBERS IN THE AMERICAN MEDICAL ASSOCIATION NOT MEMBERS OF AFFILIATED SOCIETIES.

On March 8, the Secretary of the New York State Medical Association forwarded a list of 161 names of members of the American Medical Association residing in New York who were not members of the New York State Medical Association or any of its branches, and asked that these be dropped from the roll of members of the American Medical Association. I declined to take this action, because I could find nothing in the Constitution and By-Laws authorizing me to do so. While it is plain that such membership as that referred to is not possible if the By-Laws are enforced, there is nothing to indicate who shall take action, and I so informed the officers of the New York State Medical Association.

I would call attention to the necessity of a modification of the By-Laws, specifically stating what shall be done in such cases, and who shall do it. This can probably be done by resolution. The By-Laws do not state who shall take action, whether it shall be the President, the Treasurer, the Secretary or the Judicial Council.

In this connection I beg to call attention to the fact that there are many men holding membership in the American Medical Association in practically every state and territory who are not entitled to membership even under the old Constitution and By-Laws. These became members while eligible, but have lost their membership in the society through which they obtained their membership, either by change of location, by expulsion or suspension, by the society becoming defunct or in other ways. Whatever the cause there has been no way of keeping in touch with such matters in the past, since there has been no close relationship between this Association and its subordinate branches and no attempt to report to the higher body on the part of the lower. In the future, when we become organized according to the proposed plan, it is presumed that a systematic method of reporting by the county society to the state society, and by the state society to this Association will be adopted and carried out. The present conditions are certainly not satisfactory. We have had on our books as members until quite recently, and probably have yet, men who are the veriest quacks and the most notorious advertisers in the country. This has occurred from the fact that it is impossible to keep in touch with each individual member unless it is done systematically by such reporting as it is hoped will soon be adopted.

#### VERIFICATION OF MEMBERSHIP QUALIFICATION.

On my suggestion, the President, last February, authorized me to proceed to verify the membership list by sending to each member a blank on which he should give all necessary information in regard to his membership and other biographical information. The former was put in the form of questions to elicit the following points: When the member joined the Association: through what society; if there is a county society in his own county, and if so, if he belongs to it; and also if he belongs to his state society. The biographical information asked for, while it has no relation to membership, we thought would be advisable to obtain at this time as a basis for a biographical list of members in the future. For various reasons it has been impossible to make much more than a beginning in this work. We have covered only seven states, viz., Alabama, Arkansas, Arizona, California, Colorado, Connecticut and New York (the blanks received from New York shows only 104 not eligible) with the following results: Alabama—Blanks sent, 86; returned, 73; not returned, 13; eligible, 71; not eligible, 2. Arkansas—Blanks sent, 108; returned, 94; not returned, 14; eligible, 88; not eligible, 6. Arizona—Blanks sent, 18; returned, 12; not returned, 6; eligible, 8; not eligible, 4. California—Blanks sent, 366; returned, 289; not returned, 77; eligible, 268; not eligible, 19. Colorado—Blanks sent, 283; returned, 224; not returned, 59; eligible, 201; not eligible, 23.

Connecticut—Blanks sent, 149; returned, 121; not returned, 28; eligible, 121. New York—Blanks sent, 744; returned, 611; not returned, 133; eligible, 507; not eligible, 104. This makes a total from the seven states of 158 not eligible to membership. The total number of those not responding, even after a second request, is 330, and it is fair to presume that these have not responded, in many instances at least, because such response would show them to be ineligible to membership.

The total number of members in these states, Jan. 1, 1902, was 1726, showing that over 9 per cent, are not eligible to membership. The same percentage covering the whole country would show that there are over 1000 members in the American Medical Association who are not eligible to membership, if the Constitution and By-Laws are strictly enforced, but this will probably be below rather than above the real number.

#### ENFORCEMENT OF LAW NECESSARY TO SUCCESSFUL ORGANIZATION.

With the knowledge obtained from the study of the question during the past three years, and from the correspondence, I do not believe that we should allow matters to go on in the future as we have done in the past. There should be a rigid enforcement of the Constitution and By-Laws in every instance, for only in this way can we have an organized profession. By dropping certain ones under the rules, we may lose temporarily, but I believe that we will gain many more than we will lose. This assertion is based on individual cases that have come to my knowledge. Nevertheless, I can not but believe that we should act in a conservative manner toward those who are now in the Association and who are not eligible to this membership. We find that there are men who have been members of the Association for 25 years, and more, but who for some reason have no society affiliation, and yet stand well in the profession and in the community in which they live. It seems to me that it would be very much better to notify all such that their membership must terminate in a definite length of time, say six months, or at the outside one year, provided they do not affiliate themselves with a recognized branch of this Association. This would be very much better than to drop their names without any ceremony and without giving them a chance to rehabilitate themselves. I think the vast majority of these men will gladly conform to the Constitution and By-Laws if they are given time and are courteously requested to do so.

#### THE PRESENT REQUIREMENTS NOT NEW.

There seems to be prevailing a feeling that the By-Laws in the new Constitution requiring members to hold membership in their local society is new. To show that this is not so, and that Section 3 of Chapter I is merely restating what has always been regarded as fundamental, I quote from Article I of the Constitution printed in 1891:

"No individual who shall be under sentence of expulsion or suspension from any state or local medical society of which he may have been a member, or whose name shall have been, for non-payment of dues, dropped from the rolls of the same, shall be received as a delegate to this Association, or be allowed any privilege of a member, until he shall have been relieved from the said sentence or disability by such state or local society, or shall have paid up all arrears of membership; nor shall any person not a member and supporter of a local medical society, where such one exists, be eligible to membership in the American Medical Association."

Article XIV, p. 17, of the same Constitution says: "That the Permanent Secretary may be enabled to erase from the roll the names of those who have forfeited their membership, the Secretaries are, by special resolution, requested to send to him, annually, a corrected list of the membership of their respective societies." This was adopted so that those who were not members of affiliated societies might be dropped from membership in this Association.

Bearing on the same subject I quote from the Transactions of the American Medical Association, Vol. XXX, p. 57, 1879, the following decision by the Judicial Council: "A gentleman who is not in affiliation with a county, district or state medical society, where such organizations exist, is not entitled to be registered as a permanent member upon the claim of having been a delegate from a body not now entitled to representation in this body."

#### ABSTRACTS WITH TITLES.

The official program this year contains 390 titles, 132 of which have no accompanying abstract. (35 men have 2 papers, 1 has 3 papers, and 1 has 4 papers.) Section 5 of Chapter IX is definite in regard to this matter, and the attention of the Section officers was called to it. If it is your desire that this By-Law be enforced, I suggest that a resolution

be adopted covering the matter, and if the Secretary is to enforce it, the resolution should so state. (It is my opinion that the minimum number of words in these abstracts should be 25 and the maximum 150, not 50 and 200 as at present.)

Considering the fact that the Section officers, with only an occasional exception, are new each year and unacquainted with the work or rules governing the Section, I would suggest that the Secretary be authorized to send a circular each year to the Section officers, calling attention definitely to all the rules and by-laws relating to their duties. I have done this for the past two years, but only in a vague and general way, as I did not feel authorized to do more than this.

I would also suggest that printed slips be furnished Section officers, to be sent to all whose names are to appear on the program, these slips to contain the rules governing titles, abstracts, time at which these shall be in, rights of publication, etc., so that authors, too, may know what is expected of them. Most of the difficulties connected with the Section programs come from the fact that too often neither the Section officers nor the authors of papers know what is expected of them. If those who desire to read papers before the Sections are definitely and early informed that under no circumstances can their titles appear on the program unless they are members of the Association, and unless their titles, together with a brief abstract of the paper, are in the hands of the Section officers thirty days before the meeting, etc., there will be no difficulty.

A resolution has been adopted by the Association on two occasions, limiting the number of papers in a Section to 35, but this is not a part of the By-Laws. If it is your desire that this rule shall be adopted for the future, and enforced, a resolution or an amendment to the By-Laws should be adopted, and this be incorporated in the instructions to Section officers.

#### ASSOCIATE MEMBERS.

The new Constitution wisely provides that "Representative teachers and students of allied sciences not physicians" may become associate members, the idea being to have such men as physiologists, pharmacists, etc., take part in some of the Sections. According to the Constitution, however, these must be elected by the House of Delegates. Would it not be better to have them become associate members in the same manner as members by invitation? Under the present circumstances, the names of these men appear on the program before they are elected.

#### THE DENTISTS.

I wish to call attention to the fact that we have a Section on Stomatology and that we have dentists as members and that dentists often make application for membership and yet the Constitution and By-Laws make no provision for such members. The only reference made to dentists in the old Constitution is in Article 3, under "Delegates," where it says that delegates shall receive their appointment by their respective state societies, etc., and "from oral and dental societies in good standing." At the Chicago meeting of the Association in 1887, the following resolution was adopted:

*"Resolved*, That the regular graduates of such dental and oral schools and colleges as require of their students a standard of preliminary or general education, and a term of professional study equal to the best class of medical colleges of this country, and embrace in this curriculum all the fundamental branches of medicine; differing chiefly by substituting practical and clinical instruction in dental and oral medicine and surgery, in place of practical and clinical instruction in general medicine and surgery, be recognized as members of the regular profession of medicine, and eligible to membership in this Association on the same conditions and subject to the same regulations as other members."

At the present time we have no method of admitting dentists, and I would suggest that this matter be considered.

(Signed.) GEORGE H. SIMMONS, M.D., Secretary.

On motion of Dr. Daniel R. Brower, Illinois, the report was referred to the Business Committee.

Dr. H. Bert Ellis moved that the Secretary be instructed to communicate with the different Sections, informing them that their banquets must not conflict in time with the meeting of the general session this evening, the Address on Surgery being at 7:30 p. m. Seconded.

After some discussion, the motion was put and declared lost.

#### Report of Board of Trustees.

The joint report of the Board of Trustees and the Treasurer for the fiscal year, Jan. 1 to Dec. 31, 1901, was presented by Dr. T. J. Happel, president of the board, as follows:

*To the Officers, Members, and House of Delegates of the American Medical Association:*

Your Board of Trustees, in compliance with the requirements of our constitution and by-laws, would submit the following annual report to you; and ask that you examine carefully, criticize, commend, condemn or suggest as your judgment may direct. Under the plan of reorganization, you have more time for the consideration of the business matters of the Association, and hence we ask your closest scrutiny of the work of the year. We do not claim to be infallible, and would be glad to have any suggestions presented that you may, as an advisory body, see fit to offer. The report as presented includes the business done in both the Treasurer's and THE JOURNAL office. The by-laws require your Treasurer to make his report to the Board, and the Board to the House of Delegates. While this is the case, we have in this report endeavored to so arrange the items as to show the two sections of the report separately.

Instead of the usual debit and credit exhibits showing the cash receipts and disbursements for the year, we present you the report of the auditors employed to examine the books and accounts, vouchers, etc., of both THE JOURNAL and the Treasurer's offices.

Submitted in this form you have the entire business of the whole year before you; Exhibit A dealing with THE JOURNAL affairs; Exhibit B with the Treasurer's receipts and disbursements; and Exhibit C being in brief a statement of the condition of your affairs Dec. 31, 1901.

We submit, first, the auditors' report:

CHICAGO, Feb. 7, 1902.

*To the Board of Trustees, American Medical Association, Chicago.*

GENTLEMEN:

We beg to report result of audits of the accounts of your Association; the accounts of George H. Simmons, manager of your publication, THE JOURNAL, and of your Treasurer, Dr. H. P. Newman, for the fiscal year ending Dec. 31, 1901.

We have followed the same line of examination as in our previous audit, and find the accounts correct, in good condition and transactions intelligently explained.

We notice that the circulation of your publication has increased from 17,446 to 22,049, and that the cost of publishing has decreased from \$5.18 to \$4.81 per year, which is certainly very gratifying.

We have prepared a schedule of members of your Association who are delinquent for the years 1899 and 1900 and find that 167 have not paid for the year 1899 and 459 for the year 1900. This list is at your disposal or will be retained by us until the next annual audit, when the same will be verified with amounts received from such delinquents during the year and for the addition of those who may be found at that time delinquent for the year 1901.

We attach herewith balance sheet for the fiscal year of THE JOURNAL office, see Exhibit A; statement of receipts and disbursements of your Treasurer, see Exhibit B; and statement of the conditions of your business, Dec. 31, 1901, see Exhibit C.

Congratulating you upon the very good showing for the year and the evidences of prosperity exhibited, we are,

Very truly yours,

HAWLEY, JONES & Co.

(See Exhibit A, on next page.)

#### Report of the Treasurer.

*To the Officers, Members and House of Delegates of the American Medical Association:*

The growth of the Association, which it is our common privilege to serve, is markedly shown in the report which I have to offer of the receipts and disbursements of the moneys in my charge, the addition of new members and the financial standing of the Association.

In the eight years of my tenure of office I have had to report nothing but continuous growth and prosperity. Each year has shown a longer list of new members, proportionately a shorter list of delinquents and greater promptness on the part of the

members in meeting their financial obligations. The summing up of the work for the year is therefore an agreeable task and carries but one regret, that the execution of the duties of this office has in a few instances given rise to slight misunderstanding by reason of the enforcement of the requirements incident to the changing of the fiscal year from June to January. Also there does not seem to be a clear interpretation of the rules governing the discontinuance of memberships for cause, whether such unpleasant task devolves upon your secretary and treasurer or upon the local organization which stands or has once stood sponsor for such membership. It would seem eminently fitting that this entire matter be recommended to the House of Delegates for definite and final action.

The following comparisons will perhaps call more particular attention to the satisfactory figures in our detailed report:

The entire membership fees for 1900 were \$46,700; for 1901, \$51,555, a net gain of \$4855. Dec. 31, 1900, we had 9841 members, and in December, 1901, there were 11,121, a gain of 1280.

In January, 1896, the receipts were \$1600; in the same month in 1897, \$4080; in 1898, \$4895; in 1899, \$8745; in 1900, \$10,215; in 1901, \$13,750, and in 1902, \$17,625.

Up to June 1 of the present year we have collected in fees \$31,566, of which \$4640 is from the new members, as we have enrolled 928 since January 1.

## EXHIBIT B.

Annual report of the Treasurer of the American Medical Association for the fiscal year commencing January 1, 1901, and ending December 31, 1901:

H. P. Newman, M.D., in account with the American Medical Association, Dr.:

| JOURNAL ink inventory                             | 37.50       |
|   | \$34,324.54 |
|   | \$91,065.65 |

## LIABILITIES.

|                  |             |
|------------------|-------------|
| Accounts payable | \$3,225.74  |
| Net worth        | \$87,839.91 |
| Net worth, 1900  | 61,821.80   |

Increase during year 1901..... \$26,018.11

## ANALYSIS FOR 1901.

|                            |              |
|----------------------------|--------------|
| Income from all sources    | \$157,645.86 |
| Less membership commission | 197.20       |
|                            | \$157,448.66 |
| Less transfers             | 7,463.00     |
|                            | \$149,985.66 |

## EXPENSES.

|                                    |              |
|------------------------------------|--------------|
| JOURNAL                            | \$113,740.06 |
| JOURNAL gain                       | \$36,245.60  |
| Treasurer and Association expenses | \$9,230.12   |
| Treasurer and JOURNAL account      | 997.37       |
| Net gain for year                  | \$26,018.11  |

## INVESTMENTS.

The investment referred to in our last annual report of a sufficient amount of money which, when added to the \$10,000 in government bonds already owned by the Association, would make about \$25,000, which was approved by the Association, was made by the purchase of fourteen (14) Chicago City school bonds of a par value of \$1000 each, which cost, including premium and interest, \$15,168.13. This gave us an interest-bearing investment of \$24,000, which yielded us an income of 3½ per cent., bringing in \$860 in 1901.

The manner in which these moneys was used does not properly belong in this report, which includes the fiscal year of 1901, beginning Jan. 1, 1901, and ending Dec. 31, 1901, but reference will be made to this matter as an addendum to this report.

## PLANT.

Our report shows an addition to the plant of one press, five (5) motors, and one linotype machine, costing \$3118.50. This, added to the \$9648.25 paid out in 1900 and \$2700 in 1899, makes a total for new machinery of \$15,456.75 paid out in the past three years.

The inventory of the machinery, made by our expert accountants, foots up only \$16,808.25. You can then see that no overvaluation is placed on anything, as we now have on hand, in addition to what we have purchased in the last two years, nearly every piece of machinery contained in the inventory presented at Atlantic City.

## PRESS ROOM AND OFFICE FURNITURE AND FIXTURES.

Additions have been made to both these departments amounting together to \$355.99, and a card index cabinet has been placed in the Treasurer's office. Many more conveniences have been needed, but the want of floor space has prevented the addition of many things necessary and essential to the economical management and running of the plant.

During the whole year the work in the mechanical department of THE JOURNAL has been much hampered by this lack of floor space. This was one of the most serious questions confronting your Board of Trustees at their last annual meet-

ing in Chicago. The lease on the floor occupied by us was soon to expire, and we were met with a demand for about double the rent we were then paying, and the further knowledge that we would have to secure more floor space than we then had. The floor space was so contracted that it was not possible to keep on hand more than one week's supply of paper. The increased business of THE JOURNAL was such as to require another press and automatic feeder and folder with no floor space on which to advantageously arrange for them. In addition to the press mentioned, or in the place of it, your Board acted favorably upon the request of the Editor for the purchase of a double flat-bed perfecting press, to be bought as soon as a place could be gotten in which this press could be located. When these purchases are made, and the plant properly installed, you will be able to boast of an up-to-date printing establishment.

## ADVERTISING DEPARTMENT.

To the ordinary JOURNAL reader, it would appear to be an easy matter to lay down an inflexible rule by which the advertising department of any publication should be governed—that this should be like the laws of the Medes and Persians—but when brought face to face with many propositions, it is found to be a very difficult matter to decide what to do in each individual case. The Trustees are endeavoring to eliminate from the pages of THE JOURNAL all advertising that could be considered objectionable from an ethical standpoint.

Some money has been lost to THE JOURNAL by the enforcement of the rule given above, but advertisements of a better class take the place of every one that drops out. We feel that we are making steady improvement along these lines.

## COMPARATIVE STATEMENT OF TREASURER'S RECEIPTS.

|   | 1900.       | 1901.       | 1902.       |
|---|-------------|-------------|-------------|

| Receipts for the first quarter.... | \$14,945.00 | \$19,775.00 | \$24,740.00 |

## JOURNAL COMPARATIVE STATEMENTS.

The following comparative statement indicates the increase in advertising collections during the past three years:

|  | 1898.       | 1899.       | 1900.       | 1901.       |
|--|-------------|-------------|-------------|-------------|
| Totals .....                                 | \$23,629.71 | \$33,760.82 | \$44,060.70 | \$59,441.82 |
| Indicating a gain for 1899 over 1898 of..... |             | \$10,131.11 |             |             |
| Indicating a gain for 1900 over 1899 of..... |             |             | \$10,299.88 |             |
| Indicating a gain for 1901 over 1900 of..... |             |             |             | \$15,381.12 |

The following is a comparative statement of the net subscriptions for the years 1898, 1899, 1900 and 1901:

|  | 1898.      | 1899.       | 1900.       | 1901.       |
|--|------------|-------------|-------------|-------------|
| Totals .....                                 | \$6,746.55 | \$12,283.52 | \$23,697.03 | \$33,793.45 |
| Indicating a gain for 1899 over 1898 of..... |            | \$5,536.97  |             |             |
| Indicating a gain for 1900 over 1899 of..... |            |             | \$11,408.51 |             |
| Indicating a gain for 1901 over 1900 of..... |            |             |             | \$10,996.42 |

|                                 | 1899. | 1900. | 1901. | 1902.  |
|---------------------------------|-------|-------|-------|--------|
| January 1—                      |       |       |       |        |
| Total number of members.....    | 7,997 | 8,445 | 9,841 | 11,107 |
| Total number of subscribers.... | 2,453 | 4,633 | 8,339 | 10,795 |

|                                | 1898.    | 1899.    | 1900.    | 1901.    |
|--------------------------------|----------|----------|----------|----------|
| Receipts of Journal office.... | \$33,566 | \$52,106 | \$74,175 | \$99,119 |

The following table shows the total number of copies issued each year, total number of pages, and amount of paper stock used:

|        | Total No. Copies. | Pages. | Reams. | Lbs. of Paper. | Tons. |
|--------|-------------------|--------|--------|----------------|-------|
| 1898.. | 597,282           | 4,756  | 3,395  | 321,525        | 157   |
| 1899.. | 710,950           | 5,382  | 4,832  | 461,420        | 230   |
| 1900.. | 907,200           | 6,987  | 6,747  | 607,230        | 303.5 |
| 1901.. | 1,146,575         | 6,510  | 9,052  | 814,680        | 407   |

The following shows the annual cost of paper stock for the past three years:

|  | 1899.       | 1900.       | 1901.       |
|--|-------------|-------------|-------------|
|  | \$22,724.00 | \$25,598.00 | \$29,835.00 |

Profits of THE JOURNAL and of the Association for the last three years are as follows (no systematic closing of books at end of year previous to 1899):

|          | Journal Profits. | Assoc'n or True Profits. | A. M. A. Expense. |
|----------|------------------|--------------------------|-------------------|
| 1899.... | \$22,451.24      | \$16,616.85              | \$5,843.39        |
| 1900.... | 21,984.79        | 14,802.22                | 7,182.57          |
| 1901.... | 36,245.60        | 26,018.11                | 10,227.49         |
|          | \$80,680.63      | \$57,487.18              | \$23,253.45       |

In explanation of the above table, the first column, "JOURNAL Profits," indicates the profits that THE JOURNAL would have made had it not been charged with the expenses of the Association proper.

The second column, under "Association or True Profits," is given the net profits after the payment of the expenses of the Association.

The third column, "A. M. A. Expenses," indicates the expenses attached to the Association, and it will be seen that this item is growing each year. These expenses are shown by Exhibit B in the Treasurer's report. It was thought best to make this distinction each year so that THE JOURNAL may have credit for what expenses strictly belong to it. While part of the expenses charged up in Exhibit B belong to those connected with collecting the annual dues from members, and thus strictly belong to THE JOURNAL, the other items have no relation to THE JOURNAL at all. Besides the items given in Exhibit B the Association is also charged by THE JOURNAL with stationery, etc., supplied to the Section officers.

The following indicates the amount paid for second-class postage for the past four years:

|  | 1898.      | 1899.      | 1900.      | 1901.      |
|--|------------|------------|------------|------------|
|  | \$2,759.31 | \$3,905.65 | \$5,616.06 | \$7,591.37 |

It must be remembered that THE JOURNAL has had during the year 178 pages of advertising from which it received no income. These pages contained a weekly report of the Officers and Committees of the Association, Contents and Digest, JOURNAL and Association announcements, etc., and deprived the JOURNAL of just that much space.

With the increase in the circulation of THE JOURNAL, the Editor has been able to obtain a substantial advance in space rates. All advertisements being payable monthly prevents the possibility of much loss from failures to collect. That business in this department continues good is evidenced by the fact that up to May 1 no requisitions have been made upon the Treasurer for any money wherewith to meet accounts in THE JOURNAL office. January, 1902, advertisements yielded \$6967.05; February, \$4617.17; March, \$4936.53, making for the first quarter of 1902 \$16,510.75, as compared with \$14,485.53 for the same length of time and for the same months for 1901, thus showing a gain of \$2025.22 for the first quarter of 1902 as compared with the same quarter of 1901.

## SUBSCRIPTION DEPARTMENT.

Our subscription department shows a healthy gain for 1901, as compared with 1900—it being 26 2 3 per cent.—the total number of copies issued in 1901 being 1,146,578, and in 1900 907,200, while as compared with 1898, the gain is nearly 100 per cent., the number of copies issued being 597,282.

The following is the detailed count of the mailing list by states, indicating the gains and losses in the States for the year 1901:

|                          | Gain. | Loss. |                      | Gain. | Loss. |
|--------------------------|-------|-------|----------------------|-------|-------|
| Alabama .....            | 35    | ..    | Alaska .....         | 1     | ..    |

Indicating an increase for January of the year 1900 over 1899 of.....2,676  
 Indicating an increase for January of the year 1901 over 1900 of.....5,207  
 Indicating an increase for January of the year 1902 over 1901 of.....3,708

We have presented this report dealing in figures more than usual in order that any of you who care to study them carefully may have data upon which to begin.

We feel that the Association can boast of as good a medical publication as is issued anywhere in the world, and one that now has the largest bona fide circulation. If every member could be made to feel that he is a part owner of this publication, and as such, is to that extent responsible for its success or failure, and would aid to the extent of securing one new subscriber, the possibilities of THE JOURNAL would be unlimited. We feel that when the full effect of the reorganization scheme is experienced and the medical profession is properly organized in accord with that scheme, every county medical society will become an agency by means of which THE JOURNAL'S circulation will be largely increased.

While the Board of Trustees and the Editor have labored together for financial success, the idea of maintaining the quality of THE JOURNAL has never been permitted to become a secondary issue. It has been kept prominently to the front.

#### SECTION PAPERS AND ABSTRACTS.

The Board of Trustees had instructed the Editor to comply with the letter of the law in getting out programs for the Saratoga meeting, but it has been impossible for him to do this inasmuch as no explicit rules had been adopted by the Association. We refer to this matter to ask the House of Delegates to rule definitely in regard to all matters connected with the number of papers in each section; the parties who may or may not be invited to read papers before the sections; the question of abstracts of papers; the publication of papers read, and the date at which all titles of papers must be in the hands of the Editor, from and after which time no changes are to be made in the program.

We would again emphasize the fact that too many papers are entered on our programs, many of them not to be read but to advertise the parties who have entered their names. Not more than thirty papers, if all are read, can be well discussed and disposed of in each section at our annual meetings; hence your secretaries of sections should be notified not to exceed that number in the program of their sections.

The appended table shows the number of papers on the programs of the sections for the years 1897, 1898, 1899, 1900 and 1901, and the number of these papers complying with the requirements of our by-laws in regard to abstracts at the St. Paul meeting.

|   | 1897. | 1898. | 1899. | 1900. | 1901 |

| Physiology and Dietetics .....     | ..                     | 12                   | 12                |
| Pathology and Bacteriology ....    | 16                     | 14                   | 30                |
|                                    | 196                    | 205                  | 391               |
| 1900: Total number papers .....    |                        |                      | 491               |
| Total number abstracted .....      |                        |                      | 229               |
| Total not abstracted .....         |                        |                      | 262               |

\* One no title.

In Program for 1901. Practice of Medicine, of papers abstracted, eleven abstracts have less than 50 words; 5 less than 25 (one only 9); 16 ranging between 15 and 110. In Obstetrics, 14 contain less than 50 words, 4 less than 25 (as low as 9); 15 between 50 and 139. Surgery and Anatomy; 5 less than 50 (none less than 31); 9, 50 to 139 (this last same paper in program of Obstetrics). Of the three papers showing abstracts in Section on Hygiene and Sanitary Science, one has 18, one 24, and one 50 words.

All papers not read will be treated as volunteer papers, and no papers from members of the medical profession in the United States who are not members of the American Medical Association will be allowed on the program. All papers read in the sections, to be entitled to publication in THE JOURNAL, must have the approval of the three members of the Executive Committee of the section in which they were read, this approval to be evidenced by the signatures of the members to such papers.

#### RECOMMENDATIONS.

We would recommend that definite action be taken along the following lines:

1. Instruct the Secretary and Editor to enter the title of no paper on the program of any Section which is not received, together with an abstract of the paper (containing not less than 50 nor more than 200 words), at least thirty (30) days before the annual meeting of the American Medical Association.
2. Place the name of no member of the medical profession on the official program who is not either a "member," a "member by invitation," an "honorary member" or an "associate member."
3. Limit the number of papers in each Section to thirty (30).
4. Fix the amount of money, if any, to be paid by the Trustees to the secretaries of the Sections for postage, etc.
5. Require all committees to limit their expenditures to the sum appropriated to their respective uses, notifying them that moneys expended; or contracts made beyond the sum appropriated will not be paid by the Association.

#### ACCOUNTS AND EXPENSES.

Your Board has had before it several accounts for postage and other expenses presented by the secretaries of some of the sections. We have been forced to decline to pay these bills, as we could find no authority for so doing. If such accounts are to be paid, a definite amount of money, not to exceed \$10, should be appropriated to the secretary of each section to cover postage and the incidental expenses of his office. He is furnished by THE JOURNAL office with his stationery, and up to this time he has been expected to pay his own postage. If any other course is to be pursued the House of Delegates should speak in no uncertain terms.

When an appropriation is made for any specific purpose no more than that amount should be spent by the committee for the use of which the appropriation is made. We are thus plain and explicit because with an appropriation of \$400 made by the Association for a pathologic exhibit the sum of \$594.87 was expended, nearly \$200 of the amount being for repairs, shelving, etc., in the exhibit room. Your Board doubted its right to pay this part of the bill, but in view of the importance of the exhibit we did meet it, but at the same time did not intend that such action could or should be taken as a precedent.

## IN CONCLUSION.

Your Board, at the Chicago meeting, was confronted with two questions of much magnitude and importance to the Association: First, the status of the Association in view of the amendments to our constitution and by-laws; and second, the best plan by which relief could be gotten for the overcrowded floor space in our rented quarters.

To determine the first question and thus to enable us understandingly to discuss and solve the second your Trustees deemed it best to secure the advice of able legal counsel, and to be guided by the opinion thus gotten. This was done as a result of the last meeting of the Board at St. Paul. The resident trustee, Dr. E. Fletcher Ingals, at some future meeting of the House of Delegates will report upon this matter. The opinion given by the attorney justified your Board in taking up and acting on the second question.

The Secretary and Editor reported an early expiration of the lease upon the floor space in the building occupied by THE JOURNAL office, and that at the end of the present lease we would be expected to pay double the amount of rent for the same floor, and that we could not secure room enough for THE JOURNAL work in the building, and besides that some new machinery needed would be too heavy to be placed anywhere in a building except in the basement. The Resident Trustee had been requested to inspect and report upon any desirable lots that might be put upon the market.

When the Trustees met in February, Dr. Ingals was able to price to the Board eight or ten plats of ground, some with and some without buildings. We inspected several of these pieces of property, and finally instructed the Resident Trustee to purchase a piece of property.

This property is on the corner of Dearborn Avenue and Indiana Street, and had on it five houses. This purchase was made and the title passed to the Association through a guarantee company on March 3 for the sum of \$42,646.96. This includes all fees connected with the purchase. Two of the houses have been torn down and on the site occupied by them we have in process of erection a "Home for THE JOURNAL and a Headquarters for the American Medical Association." The other three houses are rented out and we will get a good interest on our money for that part of the property, and as soon as the new building is ready, we will be in fine shape. When the building is completed the property will have cost us about \$70,000. Of this amount we had on hand, April 1, after paying out the \$42,646.96 for the building, nearly \$12,000. This does not include the money invested in the United States Government or Chicago City bonds, which amounts to \$24,000 face value.

The former rental expense of the JOURNAL office was \$1500. We could not renew our lease and secure space enough for our growing business for \$5000. Now we will pay out nothing for rent, thus saving the \$5000 mentioned above, and in addition will receive \$2000 per year as rental from our three (3) houses, making in this way a total of \$7000, which represents an income of 10 per cent. on the \$70,000 invested in the "Home for THE JOURNAL," as compared with a possible 3½ per cent. income from our bonds. The taxes and insurance on the buildings would be offset by the increased facilities for work in our new building and the resultant possibility of more work at a less expense.

Respectfully submitted,

T. J. HAPPEL, Pres.,  
E. E. MONTGOMERY, Vice-Pres.,  
JOSEPH M. MATHEWS,  
MILES F. PORTER,  
E. FLETCHER INGALS,  
W. L. RODMAN,  
W. W. GRANT,  
JOHN F. FULTON,  
H. L. E. JOHNSON, Sec.

On motion of Dr. A. E. Baldwin, Section on Stomatology, the report was referred to the Business Committee.

Dr. E. Eliot Harris, New York, presented the following resolution:

For more than a year some of the members of the Council of the New York State Medical Association have been engaged in a critical examination of the ethical part of the laws of the American Medical Association, resulting in the preparation of a revision of the Code of Medical Ethics. This revision has been approved by the council of the New York State Medical Association, and the delegates have been instructed to present it to the House of Delegates at this session.

*Resolved*, That the President appoint a committee of five to examine and report for final action at the annual session in 1903 the proposed revised code of medical ethics which is herewith submitted in writing;

*Resolved*, That the proposed revised code of medical ethics be published in the Association's JOURNAL three times before the meeting in 1903.

## Code of Medical Ethics.

## CHAPTER I.—OF THE DUTIES OF PHYSICIANS TO THEIR PATIENTS AND OF THE OBLIGATIONS OF PATIENTS TO THEIR PHYSICIANS.

## ARTICLE I.—DUTIES OF PHYSICIANS TO THEIR PATIENTS.

SECTION 1.—Physicians should not only be ever ready to obey the calls of the sick, but should be mindful of the high character of their mission and of the responsibility they must incur in the discharge of momentous duties. In their ministrations they should never forget that the case, the health, and the lives of those entrusted to their care depend on skill, attention, and fidelity. In their deportment they should unite tenderness, cheerfulness and firmness, and thus inspire all sufferers with gratitude, respect and confidence. These observances are the more sacred because, generally, the only tribunal to adjudge penalties for carelessness or neglect is their own conscience.

SEC. 2.—Every case committed to the charge of a physician should be treated with attention and humanity, and reasonable indulgence should be granted to the caprices of the sick. Secrecy and delicacy should be strictly observed; and the familiar and confidential intercourse to which physicians are admitted, in their professional visits, should be guarded with the most scrupulous fidelity and honor.

SEC. 3.—The obligation of secrecy extends beyond the period of professional services; none of the privacies of individual or domestic life, no infirmity of disposition or flaw of character observed during medical attendance should ever be divulged by physicians, except when imperatively required to do so by the laws of the state. The force of the obligation of secrecy is so great that physicians have been protected in its observance by courts of justice.

SEC. 4.—Frequent visits to the sick are generally requisite, since they enable the physician to arrive at a more perfect knowledge of the disease, and to meet promptly every change which may occur. But unnecessary visits are to be avoided, as they give undue anxiety to the patient.

SEC. 5.—Ordinarily, the physician should not be forward to make gloomy prognostications, but should not fail, on proper occasions, to give to the friends of the patient timely notice of danger when it really exists; and even to the patient, if absolutely necessary. This notice, however, is often so peculiarly alarming when given by the physician, that its deliverance ought to be declined whenever it can be assigned to any other person of good judgment.

SEC. 6.—The physician should be the minister of hope and comfort to the sick, since life may be lengthened or shortened not only by the acts but by the words or manner of the physician whose solemn duty is to avoid all utterances and actions having a tendency to discourage and depress the patient.

SEC. 7.—The medical attendant ought not to abandon a patient because deemed incurable; for, continued attention may be highly useful to the sufferer, and comforting to the relatives, even in the last period of the fatal malady, by alleviating pain and by soothing mental anguish.

SEC. 8.—The opportunity which a physician has of promoting and strengthening the good resolutions of patients suffering under the consequences of vicious conduct ought never to be neglected. Good counsels, or even remonstrances, will give satisfaction, not offense, if they be tactfully proffered and evince a genuine love of virtue, accompanied by a sincere interest in the welfare of the person to whom they are addressed.

## ARTICLE II.—OBLIGATIONS OF PATIENTS TO THEIR PHYSICIANS.

SECTION 1.—The members of the medical profession, upon whom is enjoined the performance of so many important and arduous duties toward the community, and who are required to make so many sacrifices of comfort, ease, and health, for the welfare of those who avail themselves of their services, are surely entitled to the highest private and public recognition.

SEC. 2.—The first duty of a patient is to select as medical adviser one who has received a sound general and special education, whose habits are good, and who is not devoted to any pursuit incompatible with professional obligations.

SEC. 3.—The sick should always apply for advice in what may appear to be a trivial case, for the slightest accident may result gravely. It is also important that the patient seek assistance in the forming stage of a violent disease and communicate unreservedly to the physician its supposed cause.

SEC. 4.—The patient should be on friendly terms with the medical adviser and bear in mind that physicians are under the strongest obligations of secrecy.

SEC. 5.—Women should never allow feelings of delicacy to prevent their disclosing the seat of their peculiar complaints. Howsoever commendable a modest reserve may be in the common occurrences of life, its strict observance in medicine is often attended with serious consequences, and a patient may sink under a painful disease which might have been prevented had timely intimation been given to the physician.

SEC. 6.—The obedience of a patient to the directions of the physician should be prompt and implicit. Failure in one particular may render an otherwise judicious treatment dangerous and even fatal. This remark is equally applicable to the unauthorized renewal of prescriptions, and to diet, drink, raiment and exercise.

SEC. 7.—As patients become convalescent they are apt to suppose that the rules prescribed for them may be disregarded, and the consequence, but too often, is a relapse of the disease.

SEC. 8.—Patients should never allow themselves to be persuaded to take any medicine whatever that may be recommended to them by the self-constituted doctors who are so frequently met with and who pretend to possess infallible remedies for every disease. Howsoever simple some of their prescriptions may appear to be, it often happens that, besides being in themselves injurious, they are productive of much mischief by contravening the plan of treatment adopted by the physician in attendance.

SEC. 9.—Whenever possible the patient should avoid even friendly visits of a physician who is not the regular attendant. But when such visits are received, there should be no conversation on the subject of the patient's disease, as a word may be spoken, without any intention of interference, which may destroy confidence in the course pursued and induce the patient to neglect the prescribed directions.

SEC. 10.—The patient or relatives should never send for a consulting physician without the express consent of the medical attendant.

SEC. 11.—Patients should, whenever practicable, send for their physicians in the morning, before the usual hour for going out, and this gives them the opportunity to so apportion their time as to prevent interference of engagements.

SEC. 12.—Except in emergencies patients should avoid calling on their medical advisers during the hours devoted to meals or sleep.

SEC. 13.—The sick should be always in readiness to receive the visits of the physician, as detention, even for a very short time, is often of serious import to some other sufferer.

## CHAPTER II.—OF THE DUTIES OF PHYSICIANS TO EACH OTHER AND TO THE PROFESSION AT LARGE.

### ARTICLE I.—DUTIES FOR THE SUPPORT OF PROFESSIONAL CHARACTER.

SECTION 1.—Every individual on entering the profession, and thereby becoming entitled to all its privileges and immunities, incurs an obligation to maintain its dignity and honor, to exalt its standing and to extend the bounds of its usefulness.

SEC. 2.—The physician should observe strictly such laws as are instituted for the government of the members of the profession; should honor the fraternity as a body; and, by unwearied diligence, should resort to every honorable means of enriching the science, and, at the same time, entertain a due respect for those seniors who, by their labors, have contributed to its advancement.

SEC. 3.—There is no profession from the members of which greater purity of character and a higher standard of moral excellence are required than the medical; and to attain such eminence is a duty every physician owes alike to the profession and to patients. It is due to these, as without it their respect and confidence can not be commanded; and to the profession because no scientific attainments can compensate for the want of correct moral principles.

SEC. 4.—It is incumbent on physicians to be temperate in all things, for the practice of medicine requires the unremitting exercise of a clear and vigorous understanding; and in emergencies—for which no physician should be unprepared—a steady hand, an acute eye, and an unclouded mind are essential to the welfare, and even to the life, of a human being.

SEC. 5.—It is derogatory to the dignity of the profession to resort to public advertisements or private cards inviting the attention of persons affected with particular diseases, offering

advice and medicine gratis and promising radical cures; or to publish cases and operations in the daily prints, or to suffer such publications to be made; to invite laymen (other than relatives who may desire to be at hand), to be present at operations; to boast of cures and remedies; to adduce certificates of skill and success; or to employ any of the other methods of charlatans.

SEC. 6.—Equally derogatory to professional character it is for a physician to hold a patent for any surgical instrument or medicine; or to dispense, or promote the use of, a secret medicine, whether it be composed by this physician or the exclusive property of others, for if such nostrum be of real efficacy, any concealment regarding it is inconsistent with beneficence and professional liberality, and if mystery alone give it public notoriety, such craft implies either disgraceful ignorance or fraudulent avarice. It is highly reprehensible for physicians to give certificates attesting the efficacy of secret medicines, or of any of the other substances that may be used medicinally.

### ARTICLE II.—PROFESSIONAL SERVICES OF PHYSICIANS TO EACH OTHER.

SECTION 1.—All practicing physicians and their immediate dependents are entitled to the gratuitous services of any one or more of the physicians residing near them.

SEC. 2.—Physicians afflicted with disease should not, as a general rule, undertake the treatment of their own sickness, nor of that of members of their family, for obvious reasons. In such circumstances they are peculiarly dependent upon each other; therefore, kind offices and professional aid should always be cheerfully and gratuitously afforded. Visits ought not, however, to be obtruded officiously, as such civility may give rise to embarrassment or interfere with that choice on which confidence depends.

SEC. 3.—When a physician is summoned, from a distance, to the bedside of a colleague in easy financial circumstances, a compensation, proportionate to traveling expenses and to the pecuniary loss entailed by absence from the accustomed field of professional labor, should be made by the patient or relatives.

### ARTICLE III.—OF THE DUTIES OF PHYSICIANS AS RESPECTS VICARIOUS OFFICES.

SECTION 1.—The affairs of life, the pursuit of health and the various accidents and contingencies to which a physician is peculiarly exposed sometimes require the temporary withdrawal of this physician from daily professional labor and the appointment of a colleague to act for a specified time.

SEC. 2.—The colleague's compliance is an act of courtesy which should always be performed with the utmost consideration for the interest and character of the family physician, and when exercised for a short period half of the pecuniary obligations for such services should be awarded to the acting physician.

### ARTICLE IV.—OF THE DUTIES OF PHYSICIANS IN REGARD TO CONSULTATIONS.

SECTION 1.—The broadest dictates of humanity should be obeyed by physicians whenever and wherever their services are needed to meet emergencies occasioned by disease or accident.

SEC. 2.—The good of the patient being the sole object in view, any physician having a license to practice medicine conferred by a medical board authorized by the state may be aided in consultation.

SEC. 3.—No physician who indicates to the public that his practice is based on a sectarian system of medicine shall be entitled to professional fellowship or to recognition in medical bodies.

SEC. 4.—Consultations should be promoted in difficult cases, as they give rise to confidence and more enlarged views in practice.

SEC. 5.—The utmost punctuality should be observed in the visits of physicians when they are to hold consultations, and this is generally practicable, for society has been so considerate as to allow the plea of a professional engagement to take precedence over all others and to be a good reason for the relinquishment of any present occupation.

SEC. 6.—As professional engagements may sometimes interfere and delay one of the parties, the physician who first arrives should wait for a reasonable time, after which the consultation should be considered as postponed to a new appointment.

SEC. 7.—In consultations no rivalry or jealousy should be indulged; candor, probity and all due respect should be observed toward the physician in charge of the case.

SEC. 8.—The attending physician should be the first to question the sick, after which the consultant should have the

opportunity to make such further inquiries as may be necessary.

SEC. 9.—After due examination of the patient, both physicians should retire to a private place for deliberation; and the one first in attendance should communicate the directions, agreed upon, to the patient or friends, as well as any opinion which it may be thought proper to express.

SEC. 10.—No statement or discussion of the case should take place before the patient or friends, except in the presence of all the physicians attending, and by their common consent; and no opinions or prognostications should be delivered which are not the result of previous deliberation and concurrence.

SEC. 11.—The opinion of the physician in attendance should be delivered first to the patient or friends; and when there are several consultants they should deliver their opinions in the order in which they have been called.

SEC. 12.—No decision should restrain the attending physician from making such variations in the mode of treatment as any subsequent unexpected change in the character of the case may demand. But at the next consultation reasons for the variations should be stated. The same privilege, with its obligation, belongs to the consultant when sent for in an emergency during the absence of the family physician.

SEC. 13.—The attending physician, at any time, may prescribe for the patient; not so the consultant, when alone, except in a case of emergency or when called from a considerable distance. In case of emergency the consultant should do what is needed, and in the other case should do no more than make an examination of the patient and leave a written opinion, under seal, to be delivered to the attending physician.

SEC. 14.—In consultations theoretical discussions should be avoided, as occasioning perplexity and loss of time. For there may be much diversity of opinion concerning speculative points, with perfect agreement in those modes of practice which are founded not on hypothesis, but on experience and observation.

SEC. 15.—All discussions in consultation should be held as confidential. Neither by words nor manner should any of the parties to a consultation assert or intimate that any part of the treatment pursued did not receive his assent.

SEC. 16.—Should an irreconcilable diversity of opinion occur when several physicians are called upon in consultation, the opinion of the majority should be considered as decisive; but if the numbers be equal on each side, then the decision should rest with the attending physician.

SEC. 17.—It may happen that two physicians can not agree in their views of the nature of a case and of the treatment to be pursued. In the event of such disagreement a third physician should, if practicable, be called in and, if circumstances prevent the adoption of this course, the patient or friends should make the selection. The physician so designated should take charge of the case and the other should then gracefully retire from any further deliberation in the consultation, or participation in the management of the case.

SEC. 18.—As circumstances sometimes arise to render a special consultation desirable, when the continued attendance of two physicians might be objectionable to the patient, the physician whose assistance is required in such cases should sedulously guard against all future, unsolicited attendance. Such consultations requiring an extraordinary portion of time and attention, at least a double fee should be expected.

SEC. 19.—A physician who is called in consultation should observe the most honorable and scrupulous regard for the character and standing of the attending physician, whose conduct of the case should be justified as far as can be, consistently with a conscientious regard for truth, and no hint or insinuation should be thrown out which could impair the confidence reposed in the attending physician.

#### ARTICLE V.—DUTIES OF PHYSICIANS IN CASES OF INTERFERENCE.

SECTION 1.—Medicine being a liberal profession, those admitted to its ranks should found their expectations of practice entirely on the extent of their medical education.

SEC. 2.—The physician, in his intercourse with a patient under the care of another physician, should observe the strictest caution and reserve; should give no disingenuous hints relative to the nature and treatment of the patient's disorder, nor should the course of conduct of this physician directly or indirectly tend to diminish the trust reposed in the attending physician.

SEC. 3.—The same circumspection should be observed when, from motives of business or friendship, a physician is prompted to visit a person who is under the direction of another physician. Indeed, such visits should be avoided, except under

peculiar circumstances; and when they are made, no particular inquiries should be instituted relative to the nature of the disease, or the remedies employed, but the topics of conversation should be as foreign to the case as circumstances will admit.

SEC. 4.—A physician ought not to take charge of, or prescribe for, a patient who has recently been under the care of another physician in the same illness, except in case of a sudden emergency, or in consultation with the physician previously in attendance, or when that physician has relinquished the case or has been dismissed in due form.

SEC. 5.—Placed in the position stated in the preceding section, the physician should never throw out damaging insinuations on the practice previously adopted, and, indeed, should justify it if consistent with truth and probity; for it often happens that patients become dissatisfied when they are not immediately relieved, and, as many diseases are naturally protracted, the seeming want of success, in the first stage of treatment, affords no evidence of a lack of knowledge or skill.

SEC. 6.—When a physician is called to an urgent case, because the family attendant is not at hand, unless assistance in consultation is desired, this physician should resign the care of the patient immediately on the arrival of the family physician.

SEC. 7.—It often happens, in cases of sudden illness, or of accidents and injuries, owing to the alarm and anxiety of friends, that several physicians are simultaneously summoned. Under these circumstances, courtesy should assign the patient to the first who arrives and who, if necessary, may invoke the aid of some of those present. In such a case, however, the acting physician should cause the family physician to be called, and should withdraw unless requested to continue in attendance.

SEC. 8.—Whenever a physician is called to the patient of another physician during the enforced absence of that physician the case should be surrendered on the return of the absentee.

SEC. 9.—A physician, while visiting a sick person in the country, may be asked to see another physician's patient in consequence of a sudden aggravation of the disease. On such an occasion the immediate needs of the patient should be attended to and the case relinquished on the arrival of the attending physician.

SEC. 10.—When a physician who has been engaged to attend an obstetric case is absent and another is sent for, delivery being accomplished during the vicarious attendance, the acting physician is entitled to half the fee, but must resign the patient on the arrival of the physician first engaged.

#### ARTICLE VI.—OF DIFFERENCES BETWEEN PHYSICIANS.

SECTION 1.—Diversity of opinion and opposition of interest may, in the medical as in other professions, sometimes occasion controversy and even contention. Whenever such cases unfortunately occur and can not be immediately terminated, they should be referred to the arbitration of a sufficient number of physicians or a court-medical.

SEC. 2.—A peculiar reserve must be maintained by physicians toward the public in regard to some professional questions, and as there exist many points in medical ethics and etiquette through which the feelings of physicians may be painfully assailed in their intercourse, and which can not be understood or appreciated by general society, neither the subject-matter of their differences nor the adjudication of the arbitrators should be made public.

#### ARTICLE VII.—OF PECUNIARY ACKNOWLEDGMENT.

SECTION 1.—There is no profession by the members of which eleemosynary services are more liberally dispensed than the medical, but justice requires that some limits should be placed to their performance.

SEC. 2.—Poverty, mutual professional obligations, and certain of the public duties named in Sections 1 and 2 of Article I, of Chapter III, should always be recognized as presenting valid claims for gratuitous services; but neither institutions endowed by the public or by the rich, or by societies for mutual benefit, for life insurance, or for analogous purposes, or any profession or occupation, can be admitted to possess such privilege.

SEC. 3.—It can not be justly expected of physicians to furnish certificates of inability to serve on juries, or to perform militia duty; or to testify to the state of health of persons wishing to insure their lives, obtain pensions, or the like, without a pecuniary acknowledgment. But to persons in indigent circumstances such services should always be cheerfully and freely accorded.

SEC. 4.—Some general rules should be adopted by the physicians in every town or district relative to the minimum

pecuniary acknowledgment from their patients; and it should be deemed a point of honor to adhere to these rules with as much uniformity as varying circumstances will admit.

SEC. 5.—It is derogatory to professional character for physicians to pay or to offer to pay commissions to any person whatsoever who may recommend to them patients requiring general or special treatment or surgical operations. It is equally derogatory to professional character for physicians to demand or to receive such commissions.

#### CHAPTER III.—OF THE DUTIES OF THE PROFESSION TO THE PUBLIC AND OF THE OBLIGATIONS OF THE PUBLIC TO THE PROFESSION.

##### ARTICLE I.—DUTIES OF THE PROFESSION TO THE PUBLIC.

SECTION 1.—As good citizens it is the duty of physicians to be very vigilant for the welfare of the community, and to bear their part in sustaining its institutions and burdens; they should also be ever ready to give counsel to the public in relation to subjects especially appertaining to their profession, as on questions of sanitary police, public hygiene and legal medicine.

SEC. 2.—it is the province of physicians to enlighten the public in regard to quarantine regulations; to the location, arrangement, and dietaries of hospitals, asylums, schools, prisons and similar institutions; in relation to the sanitary police of towns, as drainage, ventilation, etc.; and in regard to measures for the prevention of epidemic and contagious diseases; and when pestilence prevails, it is their duty to face the danger, and to continue their labors for the alleviation of the suffering people, even at the risk of their own lives.

SEC. 3.—Physicians, when called on by legally constituted authorities, should always be ready to enlighten inquests and courts of justice on subjects, strictly medical, such as involve questions relating to sanity, legitimacy, murder by poison or other violent means, and various other subjects embraced in the science of medical jurisprudence. It is but just, however, for them to expect due compensation for their services.

SEC. 4.—It is the duty of physicians, who are frequent witnesses of the great wrongs committed by charlatans, and of the injury to health and even destruction of life caused by the use of their treatment, to enlighten the public on these subjects, and to make known the injuries sustained by the unwary from the devices and pretensions of these artful impostors.

SEC. 5.—Physicians ought to use all the influence which they possess, to discourage pharmacists from vending the secret or other medicines of charlatans, or from being in any way engaged in their manufacture.

##### ARTICLE II.—OBLIGATIONS OF THE PUBLIC TO PHYSICIANS.

SECTION 1.—The benefits accruing to the public, directly and indirectly, from the unwearied labors of the profession, are so numerous and important that physicians are entitled to the utmost consideration and respect from the community.

SEC. 2.—The public ought to entertain a just appreciation of medical qualifications; to make a proper discrimination between true science and the assumptions of ignorance and charlatanism; and to afford every encouragement and facility for the acquisition of thorough medical education.

Dr. Charles A. L. Reed, Ohio, moved the adoption of the resolution, which was seconded by several delegates, and referred to a special committee to be appointed by the Chair.

Dr. MacCormack moved, in order to expedite business, that the reports of the Secretary and the joint report of the Board of Trustees and Treasurer be referred to a special committee of three to be appointed by the Chair. Carried.

Dr. Charles A. L. Reed presented an affidavit regarding Dr. Wende, of Buffalo, who had been denied admission as a member of the House of Delegates from one of the Sections, and moved that it be referred to the Business Committee. Seconded.

After some discussion by Drs. John B. Roberts, Pennsylvania; Charles A. L. Reed and P. Maxwell Foshay, Ohio, the Chair ruled that this matter should go before the Judicial Council.

#### Report of Judicial Council.

Dr. Frederick Holme Wiggin presented the report of the Judicial Council, as follows:

SARATOGA SPRINGS, N. Y., June 10, 1902.

The Council met at 9 a. m., in the parlor of Cottage 4, United States Hotel, there being present the following members: Dr. C. S. Rodman, chairman; Drs. G. B. Gillespie, R. C. Moore, N. Fred Essig, J. B. Murphy, H. H. Grant, J. B. Roberts, Preston H. Bailhache, Philip Marvel and F. H. Wiggin, secretary.

The following resolution in the matter of the charges preferred against Dr. Edwin Rosenthal, Philadelphia, was unanimously adopted:

The Judicial Council reports that it has investigated the matter of the alleged advertisement of a certain antitoxin in the address of Dr. Edwin Rosenthal, Chairman of the Section of Diseases of Children in 1900, and renders the following decision:

Dr. Edwin Rosenthal, as chairman of the Section of Diseases of Children, did use his official position in a way to advertise a certain firm of manufacturers of antitoxin, but this action was unintentional on his part, and uninfluenced by the said firm.

The Council adjourned to meet at Parlor 4, United States Hotel, Wednesday, June 11, 8:30 a. m.

FREDERICK HOLME WIGGIN, Secretary.

It was moved and seconded that the report be adopted.

After some discussion as to the proper disposition of this report by Drs. Bishop, Roberts, Baldwin, the Chair ruled that the matter stand as reported, and that no further action was necessary.

Dr. Emil Mayer, Section on Laryngology and Otology, moved, seconded by Dr. Geo. C. Stout, of the same Section, that when the House of Delegates adjourns, it does so to meet on Wednesday, June 11, at 2 p. m. Carried.

The President called for the report of the Committee on National Medical Legislation.

As this report was long, Dr. E. D. Ferguson moved that it be postponed until the next session of the House of Delegates. Carried.

Dr. E. D. Ferguson offered the following resolution, which was referred to the Business Committee:

*Resolved*, That the Nominating Committee for this annual session of the House of Delegates be constituted by the division of the country into nine (9) geographical districts, the delegates from each district to meet immediately at the close of this session and select one of their number in each district to serve on the Nominating Committee, such selections to be certified and made known to the Secretary, so that he can announce them at the opening of the second daily session. The delegates representing the twelve sections of the Association shall act, for this purpose, with the delegates from the States in the geographical district where they reside, and the delegates representing the Army, the Navy, and the Marine-Hospital Service are assigned to the District of Columbia. The nine geographical divisions shall be constituted as follows:

First, or New England: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut.

Second, or Middle Atlantic: New York, New Jersey, Pennsylvania, Delaware, Maryland.

Third, or South Atlantic: District of Columbia, Virginia, North Carolina, South Carolina, Georgia, Florida, Porto Rico.

Fourth, or South Central: Alabama, Mississippi, Louisiana, Tennessee, Arkansas.

Fifth, or Central: Kentucky, Missouri, Ohio, West Virginia, Indiana.

Sixth, or North Central: Michigan, Illinois, Wisconsin, Minnesota, Iowa.

Seventh, or Northwestern: New Mexico, Indian Territory, California, Kansas, Arizona, Nevada.

Eighth, or Central Western: Oregon, Utah, Colorado, Nebraska, Oklahoma, Texas.

Ninth, or Southwestern: Hawaii, Washington, Idaho, Montana, North Dakota, South Dakota, Alaska, Wyoming.

#### Reports of Lists of Members by Secretaries of State Societies.

Dr. E. D. Ferguson presented the following:

*Resolved*, That on or about the first day of January, in each year, the Secretary of the American Medical Association shall call upon the secretaries of the affiliated state organizations for a correct list of the members of the several state and local associations entitled to membership in the American Medical Association from their several states. He shall also ask for a supplementary list of new members and of members who have been dropped on or before the first day of May in each year, and it shall be his further duty to furnish a copy of these lists to the Treasurer of the American Medical Association for his guidance.

The Secretary is hereby instructed to remove from the roll of membership of the American Medical Association such names as are not on these certified lists of members, furnished by the secretaries of the state and local organizations.

*Resolved, further*, That a sufficient number of copies of the above resolutions be sent to the secretaries of the affiliated state associations for their use.

On motion, these resolutions were referred to the Business Committee.

Dr. Ferguson also presented the following, which was referred to the Business Committee:

*Resolved*, That no exhibit in the Exhibition Hall shall be allowed at the future meetings of the American Medical Association by the Committee of Arrangements unless the articles to be exhibited would be eligible to advertisement in the JOURNAL of the Association.

The Secretary of the American Medical Association shall pass on each application for space in the Exhibition Hall, and his decision shall be final.

Dr. William A. Evans, Section on Physiology and Pathology, presented the name of Henry Baldwin Ward, professor of zoology and dean of the University College of Medicine, University of Nebraska, Lincoln, for associate membership.

On motion of Dr. H. Bert Ellis, Professor Ward was elected an associate member.

Dr. R. Harvey Reed, Wyoming, presented the following resolution, which was adopted:

*Resolved*, That the delegate of each of the nine sections be posted in the United States Hotel office, and that they meet in Parlor A at 10 a. m., June 11, 1902, for the purpose of selecting the member of the Nominating Committee from their respective district.

Dr. H. V. Würdemann, Section on Ophthalmology, presented the following resolution and moved its adoption:

*WHEREAS*, By an unanimous vote of the Section on Ophthalmology the name of Professor O. Haab, the eminent ophthalmologist of Zurich, Switzerland, is offered to the House of Delegates of the American Medical Association for election as an honorary member of the Association, be it

*Resolved*, That Professor O. Haab, of Zurich, be elected an honorary member of the American Medical Association, and the Secretary be instructed to transmit him the usual notification.

This was seconded by Dr. H. Bert Ellis and carried.

The Secretary read the following from the Richmond Academy of Medicine and Surgery, which was referred to the Business Committee:

RICHMOND, VA., June 5, 1902.

*Dear Doctor Edwards*:—At a meeting of the Richmond Academy of Medicine and Surgery, held to-night, it was resolved that that body request the Virginia members of the House of Delegates of the American Medical Association to ask the latter to define the ethics of regular practitioners consulting with homeopaths and other irregular practitioners. I was instructed to communicate this to you and to ask you to seek the co-operation of your fellow Virginia delegates in the matter.

MARK W. PEYSER, Secretary.

#### Personal Medical Advertisements.

The Secretary read the Kyger resolutions passed by the Kansas City Academy of Medicine, relative to the abolition from newspapers of personal advertisements, which were referred to the Business Committee.

*WHEREAS*, It can and has been shown, by ample statistics, that the American race is rapidly decreasing in its birth-rate, thereby threatening ultimate and complete decadence of the race, and

*WHEREAS*, Such decadence has become so apparent that it should claim the serious attention of those of influence and power to in any degree lessen this evil, and

*WHEREAS*, Without a special effort to investigate, it must have been observed by the most indifferent with what flagrant violation of all sense of delicacy the public press gives place to advertisements of nostrums and means intended to prevent or cut short pregnancy: these advertisements appearing in a column of the paper set apart for such purpose under the name of "Personal Medical Advertisements," and referred to as "Guarantees," "Sure Relief," "Sure Prevention," etc., occupying in some Sunday editions of reputable papers as much as two columns destined to fall into the hands of all classes, and

*WHEREAS*, We recognize the press as a most potent factor in the education of the masses: be it

*Resolved*, By the Academy of Medicine of Kansas City, Mo., that we respectfully recommend that a censorship over the public press should be exercised to the end of correcting such practice of publishing advertisements as those referred to in our whereases. Be it further

*Resolved*, That it should be deemed of sufficient moment for the attention of the Post-Office Department of the United States of America restricting or prohibiting the distribution of such papers, periodicals or magazines through the United States mail if they continue to so prostitute their columns with such matter. And be it further

*Resolved*, That a copy of these resolutions be sent every State Medical Association in the United States urging their co-operation in this movement by the adoption of these resolutions.

*Resolved*, That we request the Secretary of every State Medical Association adopting these resolutions to forward two copies, one to the American Medical Association and the other to the Postmaster-General petitioning for relief from this destructive influence.

JOHN W. KYGER, M.D.  
H. C. CROWELL, M.D.  
B. H. ZWART, M.D.  
Committee.

#### Report of the Committee on Reciprocity in Medical Licensure.

The Secretary read the report of the Committee on Reciprocity in Medical Licensure from the American Academy of Medicine, as follows:

It is recommended that the following propositions be endorsed and urged upon the medical profession:

1. That in states which have a provision for the admission of licentiates of other state boards without examination, lists

of those states the licenses of which will be so recognized, be formed and published as soon as possible; and that, in forming such lists, a rather liberal spirit be shown in the determination of what constitutes equality of requirement. In no two states, not even in the same state through a series of years, can it be expected that the standard of requirement will be exactly the same. Yet abuses likely to arise from any moderate difference in requirement can readily be guarded against by a demand for a moderate period (three years) of actual practice in the state from which the original license had been obtained.

2. That in states giving discretionary power to the examining boards, the license obtained in another state, by passing a good state examination, or even the diploma of one of the better medical colleges, be accepted after five years of practice as evidence of a sufficient training in such branches as chemistry, anatomy, physiology and pathology; and that the examination of the candidates presenting such evidence be confined to the other or so-called practical subjects.

3. That in all states in which sufficient discretionary power to do these things has not been lodged with the state board of medical examiners, the effort should be made to obtain the necessary authority, guarded by an efficient, but not too oppressive, requirement of a period of actual practice in the state from which the original license was obtained.

4. That these steps shall be taken in each separate state, irrespective of formal reciprocity or of what any state so recognized may or may not do in this direction, or of the establishment of a national board of medical examiners, or of any other desirable measures. Such other measures can be promoted independently, and will be assisted rather than hindered by the carrying out of the above suggestions.

Respectfully submitted:

Edward Jackson, L. Duncan Bulkley, N. S. Davis, Jr.

On motion, the report was referred to the Business Committee.

Dr. MacCormack, chairman of the Business Committee, reported that the Committee had considered the matter of the Richmond Academy of Medicine and Surgery, and requested that the House of Delegates send it back to the Virginia State Medical Society.

On motion, it was so ordered.

Dr. H. S. McConnell, Pennsylvania, moved that the Business Committee be requested, at the session to-morrow, to suggest the number of committees the House of Delegates should have in order to expedite business. Carried.

The Business Committee, through Dr. MacCormack, reported that it had considered the resolution offered by Dr. Ferguson creating a nominating committee, and recommended that it be passed.

On motion of Dr. H. Bert Ellis, the report was adopted and the recommendation concurred in.

On motion, the House of Delegates adjourned until Wednesday, June 11, at 2 p. m.

#### WEDNESDAY, JUNE 11.—SECOND SESSION.

The House of Delegates was called to order at 2:15 p. m. by the President.

The Secretary called the roll of delegates, and there were seventy-five present.

The Secretary read the minutes of the previous session, which were approved.

#### Committee on Code Revision.

The President announced as the committee on the resolution of Dr. Harris, namely, Committee on Revision of Code of Ethics, Dr. E. Eliot Harris, New York; Dr. William H. Welch, Baltimore; Dr. T. J. Happel, Tennessee; Dr. Nicholas Senn, Chicago, and Dr. Joseph D. Bryant, New York.

#### Judicial Council.

Under reports of committees, Dr. Wiggin presented the following report of the Judicial Council:

The complaint of Dr. C. G. Kuhlman against the California State Medical Society, referred to the Council by the House of Delegates, was considered, and on motion it was voted to refer the matter to the California State Medical Society, with the request that they make answer, and that both parties be notified of the time and place of the hearing before the Judicial Council next year.

The protest of Dr. Ernest Wendt against the action of the Association last year in dropping his name from its membership roll, and consequently from that of the House of Delegates for 1902 and 1903, to which he had been elected by a Section, referred to the Judicial Council by the House of Delegates, was then taken up, and the following resolution was unanimously adopted:

That the decision of the Judicial Council in the case of Dr. Ernest Wendt, of Buffalo, in regard to his membership in the American Medical Association is that, as previously ruled by the Judicial Council, and according to the Constitution and By-Laws of the American Medical Association, Chapter I, Section 3, the said Dr. Ernest Wendt is not a member of the American Medical Association.

#### Nominating Committee.

The Secretary announced the Nominating Committee.

First District—S. C. Gordon, Maine.

Second District—W. S. Foster, Pennsylvania.

Third District—George M. Kober, District of Columbia.

Fourth District—G. C. Savage, Tennessee.

Fifth District—Wm. H. Humiston, Section on Obstetrics and Diseases of Women.

Sixth District—William A. Evans, Section on Physiology and Pathology.

Seventh District—H. Bert Ellis, California.

Eighth District—J. C. E. King, Utah.

Ninth District—R. Harvey Reed, Wyoming.

The next order was the report of the Business Committee, which was read by the Chairman, Dr. MacCormack, as follows:

#### New Committees.

The Business Committee recommends that so much of the resolution creating it as requires it to be in continuous session during the session of the House of Delegates be repealed.

On motion, the recommendation was concurred in.

It recommends that the following special committees be appointed by the President:

1. A committee of three on Sections and Section Work.
2. A committee of three on Revision of the List of Members.
3. A committee of five on Finance.
4. A committee of five on Relation of Dentists and Pharmacists.
5. A committee of three on Organization.
6. A committee of nine on Transportation and Place of Meeting.

On motion, this section of the report was adopted.

Your Committee further recommends that the action taken by the House at its first session referring the reports of the Secretary and Board of Trustees to a special committee of five be rescinded, and that so much of the address of the President as refers to Sections be referred to the Committee on Sections and Section Work; that so much of it as relates to Reciprocity in Licensure to practice medicine and to a Voluntary National Licensing Board be referred to the Committee on Medical Legislation; that so much of it as relates to alterations in the Constitution and By-Laws, and to continuing the work of encouraging the organization of state and county societies, be referred to the Committee on Organization; that so much of it as relates to the appointment of a national organizer jointly to the Committee on Organization and the Board of Trustees, be referred to the latter, with power to act.

On motion, this part of the report was adopted.

Your Committee recommends that so much of the report of the Secretary as relates to membership lists of members, and the enforcement of the provisions of the Constitution and By-Laws in regard to the same, be referred to the Committee on Revision of the List of Members; that so much of his report as relates to programs of sections, papers, abstracts and titles, be referred to the Committee on Sections and Section Work; that so much of said report as relates to dentists and their eligibility for membership be referred to the Committee on Relation of Dentists and Pharmacists; that that portion of the report of the Board of Trustees referring to the number of papers, the parties who may read them, and their publication, be referred to the Committee on Sections and Section Work; that the portion of it relating to the accounts of Section officers and the appropriation of money for meeting their expenses be referred to the Committee on Sections and Section Work.

On motion of Dr. Ellis, this section of the report was adopted.

A motion was then made and carried that the report of the Business Committee be adopted as a whole.

The President announced the following committees, as provided for by the report of the Business Committee:

*Committee on Sections and Section Work:* Drs. L. S. McMurtry, Section on Obstetrics and Diseases of Women; William Osler, Maryland; Emil Mayer, Section on Laryngology and Otology; Victor C. Vaughan, Michigan, and N. S. Davis, Jr., Section on Hygiene and Sanitary Science.

*Committee on Revision of List of Members:* Drs. William T. Bishop, Pennsylvania; F. H. Wiggin, New York; George H. Simmons, Secretary of the Association.

*Committee on Finance:* Drs. W. H. Sanders, Alabama; John B. Roberts, Pennsylvania; J. A. Dibrell, Arkansas; D. C. Hawley, Vermont, and Harold N. Moyer, Section on Nervous and Mental Diseases.

*Committee on Organization:* Drs. J. N. MacCormack, Kentucky; P. Maxwell Foshay, Ohio, and George H. Simmons, Secretary of the Association.

*Committee on Transportation and Place of Meeting:* Dr. Thomas Hunt Stucky, Kentucky; W. G. Harrison, Alabama; R. Harvey Reed, Wyoming; Seth C. Gordon, Maine; Philip Marvel, New Jersey; Geo. C. Bryan, New Mexico; H. A. West, Texas; George R. Dean, South Carolina, and H. Bert Ellis, California.

Dr. H. L. E. Johnson, of Washington, D. C., read the report of the Committee on National Medical Legislation, which will be published later.

On motion of Dr. John B. Roberts, the report was received in its entirety and referred to the Business Committee.

The next order was the report of the Committee on Organization, which was presented by Dr. Foshay.

#### Committee on Organization.

During the past year two separate tasks were assigned to this committee. At the last annual meeting of the Association your committee was ordered to take the new constitution and by-laws and make such verbal and other alterations as might be necessary to secure a complete, harmonious and well-constructed instrument. In accordance with these instructions, we submit a copy of the constitution and by-laws corrected in only a few particulars.

In the second place, the committee was assigned the duty of drafting a constitution and by-laws for State Associations which should embody the principles adopted by this Association at its last meeting. The committee held two meetings during the winter, one at Cincinnati and one at Cleveland. At these meetings and by correspondence your committee formulated such an instrument which has since been adopted without material change by the State Associations of Tennessee, Kentucky, Ohio, Arkansas and Missouri. In other states this constitution and by-laws will soon be submitted for consideration and adoption. Your committee herewith submits a copy of this document, and asks the House of Delegates to give to it the stamp of the Association's approval. [This constitution and by-laws appeared in the issue of THE JOURNAL of May 3.]

In furtherance of the plan to put into execution a complete plan of professional organization, your committee would respectfully suggest that this or some other committee be charged with the duty of drafting a constitution and by-laws for county societies. There is a great demand for such a document from all over the country just as there was for a state plan.

The cordial spirit in which the medical profession of the entire United States has received and endorsed the efforts of the committee has been most gratifying, and encourages the belief that the profession is fully ready for the adoption of a full, dignified and correlated system of organization. This will require considerable work for some time to come, in order that the new constitution and by-laws shall be used to full advantage. The plan proposed is, of course, not self-operative. It is important, therefore, that the House of Delegates should, to the fullest extent, provide means to continue and perfect the organization of this profession. A committee, therefore, should again be charged with this duty, and in addition we recommend that the Board of Trustees be authorized to employ a national organizer to assist in carrying on this work.

During the year the committee was at some slight expense, and submits its accounts.

Dr. H. Bert Ellis moved that the report of the committee be adopted; that the Committee on Constitution and By-Laws be continued, and empowered to make such verbal corrections as may be necessary. Carried.

Dr. Foshay read the second part of the report concerning the drafting of Constitution and By-Laws for State Associations.

On motion of Dr. H. A. West, Texas, the report of the committee and the constitution were adopted, and a vote of thanks extended to the members for the efficient work done by them.

Dr. Foshay read the following resolution, which was adopted:

*Resolved*, That State associations or societies in counting members for a basis of delegate representation in this house shall count only members in good standing, who pay regular dues to the State association, either directly or indirectly through County societies.

#### Honorary Members.

Dr. Foshay moved that all nominations for honorary membership, when received from any of the Sections, shall be referred without debate to an appropriate committee, and that the election of honorary members shall be a special order of business immediately following the election of officers on the fourth day of the annual session.

Dr. H. S. McConnell, Pennsylvania, moved its adoption. Seconded and carried.

#### Vaccination.

Dr. Foshay read the following memorial from the Academy of Medicine of Cleveland to the House of Delegates of the American Medical Association, urging federal standardization of vaccine and federal inspection of the manufacture of vaccine:

WHEREAS, A widespread distrust of vaccination as a means of protection from smallpox prevails among people of all classes; and such distrust appears to have arisen from observed defective protection of bad effects attributed to vaccination; and

WHEREAS, The production and use of a reliable and safe vaccine virus is of the highest importance as the chief agency by which smallpox can be controlled, and that such virus can be produced has been shown by the results in Germany, France and England, under government methods and control; therefore be it

*Resolved*, First, that the Academy of Medicine of Cleveland, through its Council, acting at the suggestion of its Committee on Public Health, do hereby request the House of Delegates of the American Medical Association to petition Congress to pass at once such legislation as will place the production of vaccine virus under the direct control and supervision of the United States Government, under either the Agricultural Department or the United States Marine-Hospital Service.

*Resolved*, Second, that the House of Delegates of the American Medical Association be requested to appoint a committee to draft proper rules and regulations and methods for such control and supervision, and to urge their adoption as part of such proposed legislation, to be applied and enforced after the manner of the present cattle inspection and quarantine.

*Resolved*, Third, that the words "control and supervision of the United States Government" as used above are to be interpreted as meaning that vaccine virus offered for sale in this country must conform to the bacteriologic and other standards set by the proposed legislation, and that only virus properly certified as having reached such standard shall be sold or otherwise offered for use in the United States. (Referred to the Business Committee.)

#### Surgeon General Sternberg.

Dr. R. Harvey Reed offered the following preamble and resolutions:

WHEREAS, Surgeon-General George M. Sternberg has just been retired from the Army after more than forty years of faithful and distinguished service, not only on numerous battle fields and in the face of cholera and yellow fever epidemics, but also as chief of the medical corps which he has elevated to its present high standard by precept and example, and notably by the establishment of the Army Medical School; and

WHEREAS, His contributions to science and strong personal efforts as a pioneer in bacteriology at remote and isolated military posts have stimulated medical research and the advancement of American medicine more especially, in the field of hygiene and sanitary science,

*Resolved*, That the thanks of the American Medical Association be tendered to him for his beneficent labors in scientific medicine;

*Resolved*, That the Committee on National Legislation be instructed to secure the passage by Congress of the provisions of Senate Act 5213, so that Dr. Sternberg's services to his country and to humanity may receive official recognition and reward.

The resolutions were adopted.

#### Vote of Thanks to Yellow Fever Investigators.

Dr. Victor C. Vaughan offered the following resolutions, which were adopted:

WHEREAS, The members of the American Medical Association believe that the recent work of the U. S. Army surgeons in Cuba

in relation to the discovery of the method of transmission of yellow fever is of such magnitude and far-reaching beneficence as to rank only second with Jenner's discovery of vaccination, and

WHEREAS, The practical value of this discovery has been proven by the complete eradication of this scourge from Havana,

*Resolved*, That the thanks of this Association be tendered the gentlemen who accomplished this brilliant result, and particularly to Drs. Walter Reed, James Carroll, A. Agramonte, W. C. Gorgas, and to Leonard Wood, who recognized the importance of the work and made it possible by his hearty encouragement and assistance.

*Resolved*, That this Association while deeply deploring the death of Dr. Jesse W. Lazear, who died a martyr to science, admires and gratefully acknowledges the heroic devotion of this physician and some of the members of the Hospital Corps ... cause of humanity;

*Resolved*, That these resolutions be published in THE JOURNAL, and that copies be transmitted to Drs. Reed, Carroll, Agramonte, Wood, Gorgas, and Mrs. Lazear.

#### A Public Health System.

Dr. W. H. Sanders presented the following report and propositions, which were referred to the Business Committee.

The American Medical Association, composed, as it is, of physicians representing every state and territory of the United States, believing it one of the highest functions and most imperative duties of all wise and well-organized governments to protect their people, as far as may be done, from infectious and contagious diseases, deems this annual session an appropriate occasion for formulating and announcing the fundamental principles which, in its judgment, should underlie such a public health system as will be best adapted to the conditions prevailing in this country and as will possess the elements of efficiency and perpetuity.

The principles are embodied in the following propositions:

1. Under a series of concentric governments, such as exist in this country, a public health system should be so constructed that all municipalities, counties and states shall, under a reasonably uniform system, do such sanitary work as properly and legally belongs to them in their respective attitudes toward the constitutions of the several states, and the Constitution of the United States.

2. After the principle stated in the foregoing proposition has been complied with, all sanitary work remaining unprovided for would naturally and necessarily devolve upon the remaining one of the concentric governments, namely, the general government.

3. The physicians of the country who, by virtue of their daily contact with disease, occupy the most favorable positions for the early recognition and prompt notification of the presence of contagious and infectious diseases, and who, by virtue of expert knowledge of the subject, are best qualified to direct and supervise the application of the teachings of sanitary science, should constitute integral and responsible factors in the creation of a public health system—hence the thorough, logical and harmonious organization of the medical profession, county, state and national, should be fostered by appropriate legislation on the part of the states and the nation.

4. A public health system should be widely divorced from politics, and absolutely released from domination by commercial influence.

5. Boards of health should be composed of physicians only; likewise, health officials should be physicians, and should be either nominated or elected by the organized members of the medical profession in their respective jurisdictions.

6. The cardinal constitutional principle of local government should be jealously guarded and no attempt should ever be made to overthrow it by centralizing in the general government public health or police powers, which, according to numerous decisions of the Supreme Court, belong absolutely to the states.

7. Were the above principles incorporated into the construction of a public health system, it is believed that a symmetrical, harmonious and coherent one could be built up, the roots of which would be deeply planted in the soil of every state, and one which by a process of natural growth and development would soon project itself into a National Bureau of Public Health, with jurisdiction over such sanitary questions only as lie outside of the domain of state powers, the exercise of which would broadly promote the general welfare.

#### Committee on Credentials.

Dr. John B. Roberts offered the following resolutions, which were referred to the Business Committee:

*Resolved*, That the Chair appoint a committee of five, to be known as the Committee on Credentials and Registration.

*Resolved*, That it shall be the duty of this Committee to keep two registration lists, one of delegates, and one of alternates, and to have one of its members or a clerk constantly in the hall of meeting of the House of Delegates during all sessions of the House;

*Resolved*, That a delegate compelled to be absent from any session of the House may be represented by a duly accredited and registered alternate, provided that the name of the alternate be first reported to the Committee on Credentials and Registration at its desk in the hall of meeting.

*Resolved*, That these resolutions be standing resolutions of the House, and that the Chairman each year hereafter appoint a committee on Credentials and Registration prior to the opening of the annual session of the American Medical Association.

Dr. Charles S. Rodman, Connecticut, offered the following amendment to the by-laws:

To amend the by-laws relating to time of meeting:

Repeal Section 3 of Chapter VIII and enact as follows, namely:

The House of Delegates shall meet at 10 o'clock on the day before that fixed as the first day of the annual session. It may adjourn from time to time as may be necessary to complete its business, provided that it shall not meet at hours that conflict with the general meetings of the Association. (To lie over one year.)

Dr. Rodman also offered the following:

*Resolved*, That the American Medical Association recommends to the affiliated state societies the introduction at the next legislative sessions of their respective states, of an amendment to their medical practice acts as follows:

The provisions of this act shall not apply to those who have successfully passed the medical examinations of the United States Army, Navy, or Marine-Hospital Service. (Referred to the Business Committee.)

#### Senn Medal.

The secretary read the following report of the Committee on the Senn Medal:

The Committee on the Senn Medal begs to report as follows: The majority of the committee recommends that no prize be given this year. The minority recommends that the Senn Prize Medal be given to the essay on "Practical Surgical Anesthesia;" *nom de plume*, "Fiat Lux."

HERBERT L. BURRELL, Secretary.

Dr. H. Bert Ellis moved the adoption of the majority report. Carried.

The president called for the report of the Committee on Award of Association Medal.

In the absence of Dr. H. A. Hare, chairman, Dr. Lewis S. McMurtry, Section on Obstetrics and Diseases of Women, said that the committee simply desired at this time to report progress, but that a further report would be presented later.

The reports of the Committee on Rush Monument Fund and on Scientific Research were called for, but no reports from these committees were made.

On motion the House of Delegates adjourned until 10 a. m. Thursday.

#### THURSDAY, JUNE 12—THIRD SESSION.

The House of Delegates was called to order at 10 a. m. by the president.

In the absence of the secretary Dr. Foshay called the roll of delegates.

The minutes of the previous meeting were read, and, after some minor corrections, were approved.

The president announced as the Committee on the Relation of Dentists and Pharmacists Drs. Geo. W. Guthrie, Pennsylvania; Charles J. Kipp, New Jersey, and Thomas D. Coleman, Georgia.

The next order was the report of the Business Committee, which was read by Dr. MacCormack.

#### Business Committee.

The committee recommends that the propositions embodied in the report of Dr. Sanders, of Alabama, be referred to the Committee on Medical Legislation.

The committee recommends that the resolution of Dr. Rodman in regard to certain state laws also be referred to the same committee.

The committee recommends that the resolutions of Dr. Kyger in regard to newspaper advertising be indefinitely postponed.

The committee recommends that when the House of Delegates adjourns it adjourn until 4:30 this afternoon.

On motion of Dr. McConnell the report of the Business Committee was adopted.

The report of the Nominating Committee was read by Dr. R. Harvey Reed, the secretary of the committee.

#### Nominating Committee.

SARATOGA, N. Y., June 11, 1902.

Your Nominating Committee met at 5 p. m. and organized by electing Dr. S. C. Gordon, of Maine, chairman and Dr. R. Harvey Reed, of Wyoming, secretary.

Roll call showed all members present.

On motion of Dr. Humiston, Ohio, it was decided to proceed at once with nominations for the president.

Dr. Frank Billings of Chicago was placed in nomination by Dr. Wm. A. Evans, Section on Physiology and Pathology, and on motion Dr. Billings was made the unanimous choice of your committee for president of the Association for the year 1903. Other officers were nominated as follows:

For First Vice-President—Dr. J. A. Witherspoon, Nashville, Tenn.

For Second Vice-President—Dr. G. F. Comstock, Saratoga Springs, N. Y.

For Third Vice-President—Dr. C. R. Holmes, Cincinnati.

For Fourth Vice-President—Dr. James H. Dunn, Minneapolis, Minn.

For Treasurer—Dr. H. P. Newman, Chicago.

For Secretary—Dr. Geo. H. Simmons, Chicago.

For Trustees (For Three Years)—Dr. E. E. Montgomery, Philadelphia; Dr. H. L. E. Johnson, Washington, D. C., and Dr. A. L. Wright, Carroll, Iowa.

For Judicial Council (For Three Years, 1905)—Dr. Philip Marvel, Atlantic City, N. J.; Dr. Geo. Cook, Concord, N. H., and Dr. N. S. Davis, Jr., Chicago, Ill.

For Two Years (1904)—Dr. T. C. Martin, Cleveland, O.; Dr. J. B. Roberts, Philadelphia, and Dr. Christopher Tompkins, Richmond, Va.

For One Year (1903)—Dr. F. H. Wiggin, New York City; Dr. G. B. Gillespie, Covington, Tenn., and Dr. D. C. Peyton, Jeffersonville, Ind.

For Oration on Medicine—Dr. J. M. Anders, Philadelphia.

For Oration on Surgery—Dr. A. F. Jonas, Omaha, Neb.

For Oration on State Medicine—Dr. W. H. Welch, Baltimore, Md.

On motion by Dr. Humiston, Ohio, the secretary was instructed to prepare a ticket and have the names selected by this committee for the several offices and positions printed thereon, with sufficient space between each name for interlining and a small square at the side for an "X" to indicate the choice of any voter for any particular person, and that said ballots be used for casting the final ballot by the House of Delegates for the officers of their choice.

The committee adjourned to meet on June 12 at 9 a. m.

S. C. GORDON, Chairman.

R. HARVEY REED, Secretary.

#### Association Medal.

Dr. H. A. Hare, Philadelphia, reported on behalf of the Committee on Association Medal:

The Committee on the Association Medal for 1902 respectfully reports that owing to a misunderstanding it was not notified of its appointment until March, 1902. No essays were received. The committee believes it is desirable that rules should be prepared governing the competition for the medal, as to the length of the essay, the subject or subjects upon which it shall be prepared, the method of its publication, and the best means of publishing the fact that the prize may be competed for.

H. A. HARE, Chairman.

On motion of Dr. Ellis the report was referred to the Business Committee.

Dr. H. Bert Ellis, speaking on behalf of the Committee on Transportation and Place of Meeting, said that they had selected Dr. Thomas Hunt Stucky chairman of the committee, he to select such other associates as he might deem best fitted for the position. Hot Springs, Ark., was selected as the place for holding the next meeting.

On motion of Dr. Charles A. L. Reed this matter was referred back to the Nominating Committee to be acted upon in connection with the report of that committee tomorrow.

### Sections and Section Work.

Dr. L. S. McMurtry made the following report of the Committee on Sections and Section Work:

The Committee on Sections and Section Work recommends that the by-laws be amended by the following clauses:

I. That the number of papers upon the program of each section shall not exceed forty.

II. That no member shall read papers before more than two sections in any one year, and these papers must be on different subjects.

The Committee offers the following:

*Resolved*, That the Secretary of the Association be authorized to send immediately after each annual meeting, a circular to the Section officers, calling attention to all the by-laws and rules relating to their duties.

*Resolved*, That the retiring President at each annual meeting shall call together for reference the President-elect, the Secretary of the Association, and the officers of the Sections to plan the work for the coming year.

*Resolved*, That it shall be the duty of the President of the Association to enforce the by-laws and rules relating to the work of the Sections.

*Resolved*, That there shall be appropriated a sum not to exceed twenty-five dollars annually to cover the postage of officers of Sections.

Dr. Charles A. L. Reed moved that the report of the committee be received and adopted, with the exception of that part which relates to the amendment to the constitution and by-laws; and that that part which relates to the expenditure of moneys be referred to the Board of Trustees.

After considerable discussion by several of the members the motion was carried.

### Associate Members.

Dr. Victor C. Vaughan, a member of the Committee on Sections and Section Work, asked for an interpretation of Section 5 of the Constitution as to associate members, which reads as follows:

"Representative teachers and students of the allied sciences, not physicians, may become associate members by vote of the House of Delegates." He said a gentleman, a distinguished physiologist, who is not a member of the Association, is to read a paper before one of the sections this afternoon, and he wanted to know whether the committee was barred from electing such men as associate members. He asked an interpretation of the two words, "not physicians," and suggested that such men be designated as "unregistered or unlicensed practitioners." If this were done, some of the best men, who were doing good scientific work, could be elected associate members.

Dr. John B. Roberts moved that the words suggested by the committee be incorporated and the committee so instructed. Carried.

In accordance with that interpretation, Dr. Vaughan presented the following names for associate membership: R. H. Chittendon, of Yale; La Fayette Mendel, of Yale; A. R. Cushing, of the University of Michigan; F. G. Novy, of the University of Michigan; John J. Abel, of Johns Hopkins; W. H. Howell, of Johns Hopkins; J. Erlanger, Johns Hopkins; W. T. Porter, Harvard; W. B. Cannon, Harvard; Simon Gage, Cornell.

On motion these gentlemen were elected to associate membership.

### Informal Ballot for Officers.

The Business Committee recommends the following amendment to the by-laws:

That Section 4, Chapter 7, of the by-laws, entitled "Committees on Nominations," be repealed, and the following be inserted in lieu thereof:

Section 4.—Nominations for officers shall be by informal ballot in the House of Delegates, unless otherwise ordered by a majority of the delegates present when such nominations are made. Twenty votes shall be necessary to a nomination, and after the nominations are made the balloting shall continue until some nominee has received a majority of the votes present. After the second formal ballot the nominee receiving the lowest number of votes shall be dropped, and so on in each successive ballot until an election is had.

### President Pro Tem.

Dr. McConnell, of Pennsylvania, offered the following, which was referred to the Business Committee:

The president of the Association having too many duties to

perform, in order to relieve him to a certain extent and to expedite the business of the House of Delegates,

*Resolved*, That the House of Delegates at the commencement of each annual session, elect a President *pro tem.*, whose duties shall be to assist the President in every manner and to preside in his absence. The said President *pro tem.* shall retain his office until his successor is elected and have authority to convene the House of Delegates at the hour designated, beginning with each annual session.

### Committee on Legislation.

The following amendments, which had laid over for one year, were then read by Dr. MacCormack, of Kentucky, of the Business Committee.

Amendment to the constitution and by-laws, offered by Dr. L. B. Tuckerman, Cleveland, Ohio: Amend Section 3, Chapter VII, of the by-laws, by substituting the following:

Section 3.—*Committee on Legislation*: The Committee on Legislation shall consist of three members appointed by the president of the association for a term of three years. One member shall be a resident of Washington, D. C., one of Baltimore, and one of Philadelphia. It shall be the duty of the committee to represent before Congress the wishes of this Association regarding any proposed legislation that in any respect bears upon the promotion and preservation of the public health, or upon the material or moral welfare of the medical profession. This committee shall also invite to a conference once a year, or oftener if need be, one delegate each from the medical service of the United States Army, the United States Navy, and the Marine-Hospital Service, one from the Bureau of Animal Industry, and one from each affiliated state or territorial society; such conference to meet in Washington to consider questions of medical and sanitary legislation, and to report back to this Association and to the several state and territorial societies.

Dr. MacCormack offered as a substitute for the proposed amendment of Dr. Tuckerman the following:

Amend Section 3, Chapter VII, of the by-laws, by striking out said section and inserting in lieu thereof the following:

Section 3.—*Committee on Medical Legislation*: The Committee on Medical Legislation shall consist of three members appointed by the president, one for a term of one year, one for a term of two years, and one for a term of three years, but whose successors shall each be appointed as vacancies occur for a term of three years, and an auxiliary committee to be composed of one member from each state and territorial society represented in this Association, to be appointed annually by the president of this Association upon the nomination of such state or territorial society, and one member from the Army, Navy, and Marine-Hospital Service, to be nominated by the chief officer of these respective departments and appointed by the president of this Association. It shall be the duty of the committee to represent before Congress and elsewhere the wishes of this Association regarding any proposed legislation that in any respect bears upon the promotion and preservation of the public health or upon the material or moral welfare of the medical profession. This committee shall invite to a conference once in each year, or oftener if need be, the auxiliary committee herein created, at which shall be considered questions of national and state legislation, with the view of uniting all of the influences of the entire profession throughout the country in support of all proper legislation and of securing uniformity in the same, so far as may be possible and expedient.

Amendment to the constitution and by-laws, offered by Dr. T. J. Happel, Tennessee:

Chapter IX, Section 7, as follows: Strike out the following words of Section 7, Chapter IX, "reprints and transactions of Sections, including its list of members, its rules of order, its list of officers, as now published, shall be paid for out of the funds of the Association, and furnished free to members of the Association."

On motion this was adopted.

Dr. Harris, of New York, moved that both amendments be referred to the Business Committee, with instructions to report at the afternoon session. Carried.

### Scientific Research.

Under the head of unfinished business the report of the Committee on Scientific Research was read as follows:

Your committee begs to report that owing to its recent appointment no steps could be taken during this year to encourage scientific research by the utilization of the generous appropriation of the Association. The chairman and members of the committee appreciate the opportunity afforded them to influence wholesome, scientific work, and desire especially to make

it clear to the members of the House of Delegates that the failure of the committee to act has been unavoidable. Through the illness of the chairman of the committee before the appointment of the present one, no action could be taken last year. The appointment of the present committee dates from March 21, 1902. It is hoped that next year through early advertisement in the columns of the Journal applications may be received by the committee for participation in the grants established by the Association. There will doubtless be sufficient applications to permit a careful selection of scientific workers.

ALFRED STENGEL, *Chairman*.

On motion the report was accepted and the committee continued.

It was moved by Dr. H. O. Walker, Michigan, duly seconded, that an appropriation of \$500 be set aside by the Board of Trustees for the Committee on Scientific Research. Carried.

#### National Tuberculosis Commission.

A resolution by Dr. S. A. Knopf, of New York, of the Section on Hygiene and Sanitary Science, was read, and, on motion of Dr. H. Bert Ellis, was referred to the Committee on Legislation.

The resolution is as follows:

*Resolved*, That in view of our knowledge that several European governments have established national governmental tuberculosis commissions and recognizing the fact that tuberculosis is likewise with us a very prevalent and a preventable disease, the Section on Hygiene and Sanitary Science recommends that the American Medical Association address an appeal requesting the proper authorities to create a United States National Tuberculosis Commission for the study, investigation and prevention of tuberculosis in man and beast.

#### Dentists as Associate Members.

Dr. A. E. Baldwin offered the following, which was referred to the Business Committee:

*Resolved*, That it shall be a standing rule of the House of Delegates that the Section on Stomatology may—under Article 3, Section 5, of the Constitution, and Chapter I, Section 7, of the By-Laws—receive as associate members each year dentists of recognized and eminent standing who shall qualify as associate members and shall pay into the Treasury of the Association \$5.00, thus entitling them to the Association Journal for such year or years as they shall qualify as above.

Dr. William A. Evans offered resolutions from the Section on Physiology and Pathology, and as they involved the expenditure of money he moved that they be recommended to the Board of Trustees for favorable action. Carried.

#### Louisiana Purchase Exposition.

Dr. E. Eliot Harris, of New York, offered the following resolution, which was referred to the Business Committee:

*Resolved*, That the American Medical Association views with satisfaction the efforts that are being made by the managers of the St. Louis World's Fair to make the Exposition of 1904 the occasion for presenting to the world the most advanced medical scientific thought of the twentieth century, and that the enterprise is commended to the hearty sympathy and support of the medical profession of the United States.

#### International Medical Congress of 1906.

Dr. Charles A. L. Reed offered the following resolutions:

*Resolved*, That the American Medical Association hereby extends a cordial invitation to the International Medical Congress to hold its session for 1906 in the United States of America, at a city hereafter to be selected.

#### Delegates.

*Resolved*, That John A. Wyeth, Charles A. L. Reed, William Osler, J. B. Murphy, Raymond Guiteras, L. S. McMurtry, J. M. Matthews, Howard A. Kelly, Walter Wyman, Victor C. Vaughan, Thomas D. Coleman, Nicholas Senn, J. N. Wear, L. H. Laidley, T. H. Stucky, T. J. Murphy, N. S. Davis, Jr., E. Eliot Harris, H. V. Würdemann, Casey A. Wood, Gen. George M. Steinberg, C. J. Kipp, and George A. de Schweinitz be and are hereby appointed delegates from the American Medical Association to the International Medical Congress to be held at Madrid in 1903; that the Secretary be and is hereby instructed to issue Delegates' Certificates to such additional members as may apply for the same; and that the delegates from this Association be and are hereby instructed to carry the foregoing invitation.

The president read the names of five delegates whom he had appointed by request of the Secretary of State as delegates to the International Medical Congress as follows: Dr. Nicholas Senn, Dr. Maurice H. Richardson, Dr. George W. Crile, Dr. Richard Douglas, and Dr. Edward B. Dench.

On motion the resolutions were adopted.

#### Halls and Rooms for Meetings.

Dr. David C. Peyton, Indiana, offered the following resolution, which was referred to the Business Committee:

*Resolved*, That hereafter the ordinary and necessary expenses for halls and rooms for the General and Section Meetings, and

for Registration, shall be borne by the Association, and shall be paid by the Treasurer when certified by the Chairman of the Local Committee of Arrangements, after approval by the Board of Trustees; that hereafter the ordinary and necessary expenses for the Hall of Exhibits shall be paid by the Association when certified by the Secretary of the Association and approved by the Board of Trustees, and that the Secretary shall have charge of the assignment of spaces and charges therefor, the fund thus derived to be turned into the Treasury of the Association.

#### Incorporation.

Dr. E. Fletcher Ingals, Chicago, was accorded the privileges of the floor. He said the articles of incorporation under which the Association had been acting for two or three years were imperfect in some respects, according to the laws of the State of Illinois. As a member of the Board of Trustees he explained the salient features of a lengthy report, which was prepared by an attorney engaged by the board, the attorney having suggested such alterations as were necessary to remedy the existing defects in the articles of incorporation.

Dr. MacCormack offered the following resolution:

*Resolved*, That this part of the report of the Board of Trustees be referred back to the Board of Trustees, with a view to inquiring as to the advisability of incorporation in some other state or under national law.

On motion of Dr. Harris the resolution was referred to the Business Committee, with instructions to report this afternoon.

The secretary stated that Dr. J. R. Pennington, of Chicago, made his report last evening to the general meeting, presenting the portraits of Drs. Henry O. Marcy, James F. Hibberd and Paul F. Eve, and the following resolution was passed:

*Resolved*, That the portraits be accepted by the Association and the Committee continued to another year.

On motion the action of the General Meeting was endorsed.

On motion the House of Delegates adjourned until 4:30 p. m.

#### THURSDAY, JUNE 12—FOURTH SESSION.

The House of Delegates met at 4:30 p. m., and was called to order by the President.

In the absence of Secretary Simmons, Dr. Foshay called the roll of delegates.

The reading of the minutes of the previous session was postponed.

#### Report of Business Committee.

Dr. MacCormack presented the report of the Business Committee, as follows:

The Business Committee refers back the report of the Committee on Association Medal, with the recommendation that this Committee be authorized to make rules of competition for the medal.

The Committee would recommend that the resolution of Dr. Knopf be referred back to the Section on Hygiene and Sanitary Science, whence it came, for further elaboration.

Regarding the resolution offered by Dr. Baldwin, Section on Stomatology, the Committee recommends that it be referred to the Committee on Relation of Dentists and Pharmacists of this Association.

On motion, these recommendations were endorsed.

With reference to the resolutions of Dr. Peyton, Indiana, in regard to the Association assuming the expenses of its own meeting, the Business Committee has been in conference with the Board of Trustees for some time, and after a full interchange of views, the Committee recommends that the resolutions be postponed until next year.

It was moved and seconded that the recommendations be postponed and referred to the Board of Trustees. Carried.

In regard to the memorial from the Academy of Medicine of Cleveland, the Business Committee recommends that the House of Delegates endorse the principles embodied in the resolutions, and the Committee recommends further that the resolutions be referred to the Section on Hygiene and Sanitary Science with the request that this Section appoint a special committee to report back to the House of Delegates at its next annual meeting.

The Business Committee recommends that the substitute proposed this morning for the printed amendment to the constitution in regard to the Committee on National Legislation be adopted.

The Business Committee recommends that the amendment offered by Dr. Happel last year be adopted.

**New Committees Recommended.**

The Business Committee recommends that two additional standing committees be established, to be appointed by the President, and to consist of five members each:

1. A Committee on Public Health.
2. A Committee on Medical Education.

The Committee recommends that when the House adjourns this afternoon it adjourn to meet at 9 o'clock to-morrow morning, but that it shall convene in this hall at 7 o'clock this evening as a committee of the whole for a general discussion of the methods of professional organization.

It was moved that the recommendations of the Committee be adopted. Carried.

Dr. Arthur D. Bevan, Section on Surgery and Anatomy, presented a resolution with reference to the division of fees and commissions and asked that it be referred to the Committee on Revision of the Code of Ethics.

Dr. E. Eliot Harris, New York, said there was a provision in the Code of Ethics that had been presented before a previous session of the House of Delegates which covered practically the same ground.

Dr. H. Bert Ellis, California, moved that the resolution be referred to the Committee on Revision of Code of Ethics. Seconded.

After some discussion by Dr. Moyer, it was moved that the resolution be laid on the table. Seconded.

The President put the motion to table, and it was carried, there being 36 in favor of tabling the resolution and 19 against it.

**Against Voluntary National Examining Board.**

On motion of Dr. MacCormack, Dr. A. Walter Suiter, Secretary of the National Confederation of Medical Examining and Licensing Boards, was given the privileges of the floor.

He said that at a meeting of the Confederation, held Monday afternoon, the subject of a "Voluntary Board of National Examiners" was discussed, and subsequently referred to a committee. This committee reported as follows:

Your committee, to whom was referred the proposition originally made and discussed in the medical press by Dr. W. L. Rodman, Philadelphia, for the establishment of a voluntary board of national examiners, with instruction to consider the same and report thereon to this Confederation as to its feasibility, begs leave to report as follows:

In the opinion of your committee, this Confederation can not endorse nor approve such a proposition for the following reasons, namely:

1. A voluntary national examining board would have no power, no authority, or legal right to exist.
2. No guarantee could be given of the continuance or permanency of such voluntary board, even were the laws of the several states so modified as to meet its requirements.
3. Being a voluntary board, there could be no legal manner of constituting, changing, or limiting its membership, or defining its duties.
4. Such a board would be representative of the profession only and of the regular profession alone.
5. Without the endorsement of a state board authorized by law to grant a license to practice, a certificate of qualification from the proposed voluntary board could have no legal value whatever; and under the existing laws of the several states, the state examining boards are required to conduct the examinations and such boards can not evade, nor surrender such duty even if they desired to do so.
6. To attempt the stupendous task of securing the passage of amendments to the existing laws regulating the practice of medicine in the several states would entail enormous labor and expense, and would probably endanger the laws themselves.

EDWIN B. HARVEY, Massachusetts,  
GEORGE W. WEBSTER, Illinois,  
AUGUSTUS KORNDORFER, Pennsylvania,  
EUGENE BEACH, New York,  
W. A. SPURGEON, Indiana,

Committee.

On motion of Dr. Harold N. Moyer, the report was referred to the Committee on National Legislation.

Dr. Würdemann presented recommendations from the Section on Ophthalmology regarding tests of sight and hearing for railroad employees, which were referred to the Business Committee.

The Secretary read a report from the Board of Trustees recommending that a sum of not to exceed \$15 be appropriated as postage for each section.

On motion the recommendation was concurred in.

**Prophylaxis of Venereal Disease.**

Dr. Henry D. Holton was accorded the privileges of the floor, and presented on behalf of the Sections on Hygiene and Sanitary Science, and Cutaneous Medicine and Surgery the following resolutions, and asked their adoption and the appointment of a committee:

The following resolution introduced by Dr. Ludwig Weiss of New York City, and seconded by Dr. L. Duncan Bulkley of the same city, was adopted by the Section on Cutaneous Medicine and Surgery at its meeting, June 12, 1902, and a committee, consisting of Drs. Weiss and Bulkley of New York and Dr. Frank Montgomery of Chicago, was appointed to present the same to the Section on Hygiene and Sanitary Science of the American Medical Association:

WHEREAS, There is a burning necessity to check the spread of venereal diseases, and assuming that the states can not with impunity ignore the condition, it lays in the province of the medical profession the task of recommending to the respective state legislatures and municipalities means, not regulative, but social, economic, educative and sanitary, in their character to diminish the danger from venereal diseases:

Resolved, That the Section on Cutaneous Medicine and Surgery of the American Medical Association invites the Section on Hygiene and Sanitary Science to co-operate with the Section on Cutaneous Medicine and Surgery to bring about a propaganda in the different states looking toward the proper recognition of the dangers from venereal diseases, and to arrange for a national meeting under the auspices of the American Medical Association for the prophylaxis of venereal diseases similar to the International Conference for the Prophylaxis of Venereal Diseases which meets again this year under the authority of the Belgian government at Brussels.

HENRY W. STELWAGON, Chairman.

Dr. W. H. Sanders, Alabama, offered the following in connection with the previous resolution:

Resolved, That a joint committee of six from the Sections on Hygiene and Sanitary Science and Cutaneous Medicine and Surgery be appointed by the President to stimulate study in and uniform knowledge of the subject of the prophylaxis of venereal diseases, and to present to the American Medical Association a plan for a national meeting similar to the International Conference for the Prophylaxis of Venereal Diseases, which meets again this year in Brussels under the auspices of the Government of Belgium.

On motion, these resolutions were referred to the Business Committee.

Dr. E. D. Ferguson, New York, offered the following:

Resolved, That the Board of Trustees be hereby requested to print annually in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION a list of the names of the members by states.

On motion, this resolution was referred to the Business Committee.

**The Scientific Exhibit.**

The acting Secretary read the following recommendations from the Section on Physiology and Pathology concerning the Pathologic Exhibit, which had been referred to the Board of Trustees:

1. That the name be changed to "Scientific Exhibit."
2. That the Scientific Exhibit be placed in entire charge of a director, who shall be chosen by the Board of Trustees and be paid reasonable compensation in addition to his expenses.
3. That the Director shall also be the chairman of the committee in charge of the appropriation of the Association for the encouragement of research work.
4. That the exhibit be continued under the conditions suggested, and that an appropriation for its maintenance be made, at least as large as heretofore.
5. That the Secretaries of the various Sections shall constitute an advisory committee to the Director of the exhibit.

The Board of Trustees recommends the continuance of the appropriation of \$400, but that the appointment of a director on a salary be deferred for this year.

On motion, the report was adopted.

**Amendments Proposed.**

The Secretary read the following proposed amendments to the Constitution to lie over until next year:

Amend Section 1, Article IV, of the Constitution as follows: After the word "service" at end of paragraph, add "and the officers of the Association."

Amend Section 4, Article VIII, as follows: Strike out all after the word "to" in the second line, and insert "the office of President or Vice-Presidents."

Amend Section 10, Chapter III, of the By-laws, as follows: Strike out the words "A majority" in the first line, and insert "one third."

Amend Section 1, Chapter IV, of the By-laws, as follows: Add to the section the following, "A majority of all votes cast being necessary for election."

#### Former Secretary Atkinson Ill.

A communication was read from Dr. J. R. Jones of Philadelphia regarding the illness of Dr. William B. Atkinson, and on motion of Dr. N. S. Davis, Jr., the President was instructed to send a message of sympathy to Dr. Atkinson.

On motion, the House of Delegates then adjourned until 9 o'clock, Friday morning.

#### FRIDAY, JUNE 13—FIFTH SESSION.

The House of Delegates was called to order at 9 a. m. by the President.

#### Place of Meeting.

Dr. S. C. Gordon, of Maine, chairman of the Nominating Committee, said that several invitations had been received inviting the Association to hold its next meeting in New Orleans, La. He therefore moved to reconsider the action of the Committee on Place of Meeting. Carried.

He then moved that New Orleans be substituted for Hot Springs. Seconded.

After some discussion by Drs. D. C. Peyton of Indiana and H. A. West of Texas, the substitute was carried by a very large majority.

The next thing in order being the election of officers, the President appointed as tellers Drs. R. Harvey Reed of Wyoming and William Britt Burns, Section on Practice of Medicine. The ballots cast resulted in the election of the officers named by the Nominating Committee in the third session, Thursday morning, and the selection of New Orleans as the place for holding the next annual meeting.

The President declared the officers duly elected.

Dr. John B. Roberts, Philadelphia, presented his resignation as a member of the Judicial Council, and asked that it be accepted.

On motion of Dr. R. Harvey Reed of Wyoming the resignation was laid on the table.

On motion of Dr. J. N. MacCormack of Kentucky the thanks of the House of Delegates were tendered to the delegation from Arkansas for their kind and courteous invitation in inviting the Association to hold its next annual meeting at Hot Springs, with the regret that it was inexpedient to accept it.

Dr. William S. Foster, Pennsylvania, moved the adoption of the following resolution:

*Resolved*, That the sum of four hundred dollars, or so much thereof as may be necessary, be hereby appropriated to pay the traveling and other necessary expenses of the Committee on Organization, upon accounts presented by the members thereof, to the Board of Trustees. Carried.

Dr. MacCormack read the report of the Business Committee:

The Business Committee recommends that arrangements be so made at the next annual session that the House of Delegates shall hold its first meeting at 8 p. m. of the day preceding the first day of the General Meeting, in some commodious and centrally-located hall.

It recommends that before final adjournment to-day a new Business Committee be selected from the hold-over delegates to serve through the next annual session.

Dr. H. A. West of Texas moved that the recommendations of the Business Committee be adopted. Seconded and carried.

Dr. J. N. MacCormack, Kentucky—The Business Committee has a supplementary report to make. It recommends that the resolutions offered by Dr. W. H. Sanders and Dr. Henry D. Holton, from the Sections on State Medicine and Sanitary Science, and Cutaneous Medicine and Surgery be adopted, and that authority be given for the appointment of the committees mentioned and action asked for.

On motion of Dr. West, the report was adopted.

Dr. MacCormack—The Business Committee recommends that the resolution which came from the Section on Ophthalmology be referred back to that Section, with the request that a conference be held with the leading railway surgeons who have had a large experience, and report next year.

Dr. H. A. West of Texas moved the adoption of the recommendation. Carried.

Dr. P. Maxwell Foshay of Ohio reported on behalf of the Business Committee, stating that the Committee had held a con-

ference with the Board of Trustees in reference to articles of incorporation. The Committee had gone over the points of conflict, and had found that the changes proposed by the attorney for the Board of Trustees were not such as to cause any real disability to the operation of the new method of organization. He indicated what these changes were, and urged that they be adopted.

On motion of Dr. R. Harvey Reed of Wyoming the report was adopted.

Dr. E. D. Ferguson of New York offered the following:

*Resolved*, That the present Constitution and By-laws, up to and including the amendments made yesterday, or as amended under pending amendments at the annual session of 1903, be regarded in the conduct of business in this House of Delegates as the rules of order and standing rules until the verbal changes authorized in the Constitution and By-laws cease to be legally necessary, and are changed again to correspond with such rules of order and standing rules thus provided.

On motion of Dr. H. A. West of Texas the resolution was adopted.

Dr. Harold N. Moyer, Section on Nervous and Mental Diseases, offered the following:

*Resolved*, That when we adjourn this meeting, we adjourn to meet in the library room, 103 State Street, Chicago, Ill., Monday, June 16, at 5 p. m.

*Resolved*, That at such adjourned session no business shall be transacted excepting ratification of the work heretofore done.

On motion, the resolutions were adopted.

Dr. R. Harvey Reed of Wyoming moved a reconsideration of the action on the report of the Business Committee regarding examination of railway employes, which had just passed. Carried.

Dr. H. V. Würdemann, Section on Ophthalmology, read the following resolution:

*Resolved*, That the committee on examination of eyes and ears of railroad employes (from the Section on Ophthalmology) be instructed to bring the resolution of the American Medical Association in reference to the examination of eyes and ears of railroad employes before the railroads of the United States in every manner possible, and that the Editor of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION be instructed to print two thousand copies of the resolution and to send the same by mail, or otherwise, to addresses which may be furnished him.

Dr. Reed of Wyoming then moved that the resolution be deferred, and that three or more competent railroad surgeons be called in conference with the committee and report next year. Seconded.

After considerable discussion, the motion was put, declared lost, and the original motion to adopt was carried, there being 24 for and 16 against the adoption of the resolution.

#### Date of Meeting in 1903.

The next order of business was fixing the time of meeting.

Dr. MacCormack of Kentucky moved that the next meeting be held at such time as may be fixed by the incoming President and Secretary, after consultation with the Committee of Arrangements at New Orleans, the suggestion being made, however, that, if possible, it be between May 1 and 15. Carried.

#### Committee on Membership.

Dr. Wm. T. Bishop, Pennsylvania, read the report of the Committee on Membership as follows:

*Resolved*: 1. That the Secretary of the Association shall complete the verification of the list of members on the plan already begun, and obtain, so far as possible, correct information from the members themselves and from other sources as to the qualification of every person who now claims membership in this Association.

2. That all those who now claim membership, and who are not eligible according to our laws shall be notified by the Secretary of such fact, and that they must furnish satisfactory evidence of their qualification for membership as required by our laws on or before January 1, 1903.

3. That not later than March 1, 1903, the Secretary is directed, after notification, to drop from the roll of members all who are not eligible to membership in this Association.

4. That the word "local" in line 9, section 3, chapter I, of the By-laws, shall be construed, in this connection, to apply to the state organization, or one of its recognized branches of the state in which the person holds his legal residence.

5. That a member of this Association removing from one county or state to another may continue to hold his membership in this Association for a period not to exceed two years, without joining an affiliated society in his new place of residence, provided, however, that during this time he retains his original membership in the county or state society from which he removed.

Dr. Bishop moved the acceptance of the report and concurrence in the recommendations. Carried.

Dr. William H. Welch of Maryland moved that a special committee of five be appointed by the President to consider the

questions of a National Examining Board for License to Practice and of Interstate Reciprocity, and all other matters relating to these allied subjects, and that the resolutions presented to the House of Delegates by the National Confederation of State Medical Examining and Licensing Boards be referred to this committee; that this committee report to the House of Delegates at the next annual meeting.

Dr. MacCormack of Kentucky seconded the motion, and in addition moved that the recommendations which came from the confederation be referred to the same committee.

Dr. Welch accepted the amendment and the motion as amended was carried.

Dr. W. H. Sanders, Alabama, said that on Wednesday he submitted a series of propositions to the House of Delegates, which were referred to the Committee on Medical Legislation. He said he had a right to expect that some action be taken in regard to these propositions, and he therefore called for the reading of them.

Dr. George M. Kober of the District of Columbia moved that inasmuch as the propositions submitted by Dr. Sanders had been referred to the Committee on Legislation, that the House of Delegates give no expression in regard to them until the Committee was heard from. Carried.

Dr. H. O. Walker, Michigan, moved that the Business Committee for the ensuing year consist of Drs. Harold N. Moyer, Section on Mental and Nervous Diseases; William S. Foster, Pennsylvania; Charles A. L. Reed, Ohio; T. J. Murray, Montana, and H. A. West, Texas. Seconded and Carried.

Dr. Osborne, Section on Materia Medica, Pharmacy and Therapeutics, moved that the recommendations made by Dr. Charles S. Rodman of Connecticut in regard to medical practice acts, at a previous session of the House of Delegates, which were referred to the Committee on Legislation, be taken from that Committee and referred to the new committee of five to be appointed in accordance with the resolution of Dr. Welch. Carried.

Dr. Arthur D. Bevan, Section on Surgery and Anatomy, presented the following:

*Resolved*, That the House of Delegates recommend the adoption by the county medical societies in affiliation with this body, the following resolution:

*Resolved*, That any member of the county medical society proven guilty of division of fees, either the giving or the receiving of a part of a fee without the full knowledge of the patient, be held guilty of misconduct, for which he may be expelled from the county medical society.

He moved that this be the sense of the House of Delegates. Seconded by Dr. Walker and carried.

Dr. Floyd W. McRae, Georgia, offered the following:

*Resolved*, That it is the sense of the House of Delegates that it is unprofessional to electioneer in any way for any office or position in the gift of the American Medical Association, and that in future all such efforts will be discountenanced in every way.

*Resolved, further*, that this resolution be printed in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION. Seconded.

Dr. P. Maxwell Foshay, Ohio—I have drawn a similar resolution in conjunction with Dr. MacCormack, and wish to say, before presenting it, that the House of Delegates of the American Medical Association is a legislative body that is truly representative of the American medical profession. For all time to come the House must be conducted with parliamentary form and proper dignity in keeping with its status as a deliberative assembly speaking for a learned profession. It must ever keep in mind its dual functions of encouraging scientific research and of guarding the material interests of the medical profession. The history of our Association is one of splendid accomplishment under adverse conditions. The resolution herewith offered is not submitted in any spirit of criticism of either the near or remote past, but wholly as a declaration addressed to the future, to establish beyond question in one small but important particular, the determination of this assembly to fitly represent the highest aims of modern medicine. In the firm belief that "the office should seek the man," and that nothing less is in accord with the high aims of our profession, we ask this assembly thus to declare its purpose:

*Resolved*, That it is the sense of the House of Delegates of the American Medical Association that the solicitation of votes for office is not in keeping with the dignity of the medical profession, nor in harmony with the spirit of this Association, and

that such solicitation shall be considered a disqualification for election to any office in the gift of the Association.

I move that the resolution be substituted for the one offered by Dr. McRae. Seconded.

Dr. McRae accepted the substitute, and it was carried.

Dr. N. S. Davis, Jr., Section on Hygiene and Sanitary Science, offered the following amendment:

Moved, to omit from Chapter IX, Section 3, of the By-laws, the last sentence.

Dr. J. N. MacCormack, Kentucky, moved to amend Section 3, Article IX of the By-Laws by striking out the words "Each section shall elect annually two representatives to the House of Delegates," and insert in lieu thereof the following:

Each Section shall have the privilege of sending to the House of Delegates one delegate for every five hundred members registered in such Section at the annual session at which such delegate is elected, and one for any additional fraction of that number; but each section shall be entitled to at least one delegate.

Dr. MacCormack moved to amend Section 5, Chapter III of the By-Laws, by repealing said section.

The Secretary announced the Committee on Medical Legislation, which was appointed by the President, as follows:

Drs. R. M. Cunningham, Ensley, Alabama; William Duffield, Phoenix, Ariz.; C. R. Shinault, Helena, Ark.; George H. Evans, San Francisco, Cal.; Charles S. Rodman, Waterbury, Conn.; H. L. E. Johnson, Washington, D. C.; R. D. Murray, Key West, Fla.; T. D. Coleman, Augusta, Ga.; L. P. McCalla, Boise, Idaho; Carl E. Black, Jacksonville, Ill.; W. N. Wishard, Indianapolis, Ind.; B. F. Fortner, Vinita, I. T.; H. B. Young, Burlington, Iowa; Clarence A. McGuire, Topeka, Kan.; J. N. MacCormack, Bowling Green, Ky.; Edmond Souchon, New Orleans, La.; E. McE. Van Ness, Baltimore, Md.; James F. A. Adams, Pittsfield, Mass.; Charles E. Hooker, Grand Rapids, Mich.; H. M. Bracken, Minneapolis, Minn.; William M. Paine, Aberdeen, Miss.; F. W. McGrimmon, Butte, Mont.; J. W. Parsons, Portsmouth, N. H.; J. E. Pickard, Virginia City, Nev.; Philip Marvel, Atlantic City, N. J.; G. W. Harrison, Albuquerque, N. M.; E. Eliot Harris, New York City; Richard H. Lewis, Raleigh, N. C.; H. A. Beaudoux, Fargo, N. D.; N. R. Coleman, Columbus, Ohio; S. E. Josephi, Portland, Ore.; John B. Roberts, Philadelphia, Pa.; Gardiner T. Swarts, Providence, R. I.; E. F. Parker, Charleston, S. C.; T. J. Happel, Trenton, Tenn.; J. D. Osborne, Cleburne, Tex.; A. C. Ewing, Salt Lake City, Utah; H. D. Holton, Brattleboro, Vt.; E. T. Brady, Abingdon, Va.; J. B. Eagleson, Seattle, Wash.; W. P. Goff, Clarksburg, W. Va.; and U. O. B. Wingate, Milwaukee, Wis.

The Secretary presented the following resolution, which was adopted at the fourth meeting of the Section of Materia Medica, Pharmacy and Therapeutics:

*Resolved*, That a rule should be adopted to govern future sessions of this Association, instructing exhibitors to limit the distribution of samples and advertising matter to persons wearing the official badges of the Association.

It was moved and seconded that this resolution be adopted. Carried.

The Secretary read the following from the same section:

The Section on Materia Medica, Pharmacy and Therapeutics, at its fifth meeting, unanimously endorsed the inclosed bill, H. R. 123, report No. 1701, "To adopt the weights and measures of the metric system," as the standard weights and measures in the U. S., and asked its reference to the Association, and, if approved, its immediate transmission to the Congress now in session.

Dr. N. S. Davis, Jr., Section on Hygiene and Sanitary Science, moved that the resolution be adopted, and that it be referred to the Committee on Medical Legislation, with instructions to push its adoption by Congress. Carried.

Dr. William S. Foster, Pennsylvania, offered the following resolutions of thanks:

*Resolved*, That the thanks of the Association be extended to Dr. George F. Comstock, Chairman of the Committee of Arrangements, and his associates, for their careful and efficient preparation for this meeting.

*Resolved*, That the thanks of the Association be extended to the citizens of Saratoga Springs:

*Resolved*, That in view of the fact that a committee of ladies of Saratoga has provided so delightful an entertainment for the visiting ladies of the American Medical Association, a vote of thanks is due and hereby cordially tendered them; therefore, be it

*Resolved*, That the visiting ladies of the American Medical Association do hereby express their thanks for, and appreciation of, the kindness and courtesy shown them, and for the delightful entertainments provided for them by the ladies of Saratoga during the days of the Association.

On motion the resolutions were unanimously adopted.

The President announced the following committees:

*Committee on Reciprocity*.—Drs. W. L. Rodman, Philadelphia, Pa.; William H. Welch, Baltimore, Md.; Joseph M. Mathews, Louisville, Ky.; Henry Beates, Jr., Philadelphia, Pa., and T. J. Murray, Butte, Mont.

**Committee on Public Health.**—Drs. Charles O. Probst, Columbus, Ohio; J. N. Hurty, Indianapolis, Ind.; W. H. Sanders, Mobile, Ala.; H. A. West, Galveston, Tex., and Dr. W. C. Gorgas, U. S. Army.

**Committee on Medical Education.**—Drs. Arthur D. Bevan, Chicago, Ill.; F. W. McKee, Atlanta, Ga.; Rudolph Matas, New Orleans, La.; R. A. Marmon, U. S. Navy, and C. A. Daugherty, South Bend, Ind.

**Committee on Prophylaxis of Syphilis.**—Drs. Henry D. Holton, Brattleboro, Vt.; George M. Kober, Washington, D. C.; W. H. Sanders, Mobile, Ala.; Ludwig Weiss, New York City; L. D. Bulkley, New York City, and Frank H. Montgomery, Chicago, Ill.

**Committee on Credentials and Registration.**—Drs. George H. Simmons, Chicago, Ill., chairman; P. Maxwell Foshay, Cleveland, Ohio, and H. O. Walker, Detroit, Mich.

There being no further business to come before the House of Delegates, the President thanked the members of the House for their consideration and courtesy toward him. He said he wanted to say this much in regard to the Association as the retiring President: "It stands to-day in a position of prominence that it has heretofore never achieved, and in the spirit of progress and of reconciliation I think I can see for it in the future a greatness that probably none of us yet have dreamed of. I hope we will all work to that end, and that any prejudices which may have been instilled into us by early associations will be dissipated, and that we will go out from the House of Delegates as leaven that will have its effect upon the whole loaf. I have to thank you from the bottom of my heart for your kindness to me." [Applause.]

Dr. L. S. McMurtry, Kentucky, moved that the thanks of the House of Delegates be tendered to the President, Dr. Wyeth, for the ability and courtesy with which he had discharged his duties. Seconded and carried by rising vote.

The House of Delegates then adjourned *sine die*.

The following constituted the House of Delegates:

#### List of Delegates.

Alabama—W. H. Sanders, Mobile; W. M. Wilkerson, Montgomery; W. G. Harrison, Talladega.

Arizona—W. H. Ward, Phoenix.

Arkansas—James A. Dibrell, Little Rock.

California—H. Bert Ellis, Los Angeles.

Colorado—C. K. Fleming, Denver.

Connecticut—Charles S. Rodman, Waterbury; Charles E. Brayton, Stonington.

Delaware—Willard Springer, Wilmington.

District of Columbia—George M. Kober, Washington.

Florida—R. D. Murray, Key West.

Georgia—Floyd W. McKee, Atlanta; Thos. D. Coleman, Augusta.

Idaho—

Illinois—J. L. Wiggins, East St. Louis; O. B. Will, Peoria; John T. McAnally, Carbondale; D. R. Brower, Chicago; H. Hatch, Quincy; J. B. Murphy, Chicago; George N. Krider, Springfield; George W. Webster, Chicago.

Indian Territory—

Indiana—David C. Peyton, Jeffersonville; G. W. H. Kemper, Muncie; William N. Wishard, Indianapolis; Edwin Walker, Evansville.

Iowa—George F. Jenkins, Keokuk; J. R. Guthrie, Dubuque, Kansas—

Kentucky—J. N. MacCormack, Bowling Green; Thomas Hunt Stucky, Louisville.

Louisiana—

Maine—Seth C. Gordon, Portland.

Maryland—William Osler, Baltimore; W. H. Welch, Baltimore.

Massachusetts—Horace E. Marion, Boston; Chas. H. Williams, Boston; J. F. A. Adams, Pittsfield.

Michigan—H. O. Walker, Detroit; Victor C. Vaughan, Ann Arbor.

Minnesota—A. W. Abbott, Minneapolis.

Mississippi—J. C. Hall, Anguilla.

Missouri—

Montana—T. J. Murray, Butte.

Nebraska—B. B. Davis, Omaha.

New Hampshire—Ira J. Prouty, Keene.

New Jersey—Charles J. Kipp, Newark; Luther M. Halsey, Williamstown; Philip Marvel, Atlantic City.

New Mexico—George C. Bryan, Alamogordo.

New York—E. D. Ferguson, Troy; E. Eliot Harris, New York City; C. A. Wall, Buffalo.

Nevada—

North Carolina—Jas. A. Burroughs, Asheville.

North Dakota—I. N. Wear, Fargo.

Ohio—P. Maxwell Foshay, Cleveland; Charles A. L. Reed, Cincinnati; Frank Warner, Columbus.

Oklahoma Territory—

Oregon—Andrew C. Smith, Portland.

Pennsylvania—A. P. Hull, Montgomery; Webster B. Lowman, Johnstown; George W. Guthrie, Wilkes-Barre; William S. Foster, Pittsburg; John B. Roberts, Philadelphia; H. S. McConnell, New Brighton; William T. Bishop, Harrisburg.

Rhode Island—John Champlin, Westerly.

South Carolina—George R. Dean, Spartanburg.

South Dakota—J. L. Stewart, Irene.

Tennessee—G. C. Savage, Nashville.

Texas—H. A. West, Galveston.

U. S. Army—D. M. Appel.

U. S. Marine Hospital Service—Walter Wyman.

U. S. Navy—R. A. Marmion.

Utah—J. C. E. King—Salt Lake City.

Vermont—D. C. Hawley, Burlington.

Virginia—J. R. Gildersleeve, Tazewell; Landon B. Edwards, Richmond; E. G. Williams, Richmond.

Washington—P. W. Willis, Seattle.

West Virginia—L. D. Wilson, Wheeling.

Wisconsin—W. T. Sarles, Sparta; J. R. Barnett, Neenah.

Wyoming—R. Harvey Reed, Rock Springs.

#### Sections.

Cutaneous Medicine and Surgery—William T. Corlett, Cleveland, Ohio.

Diseases of Children—A. C. Cotton, Chicago; S. W. Kelley, Cleveland, Ohio.

Hygiene and Sanitary Science—S. G. Bonney, Denver, Colo.; N. S. Davis, Jr., Chicago.

Laryngology and Otology—Emil Mayer, New York, N. Y.; George C. Stout, Philadelphia, Pa.

Materia Medica, Pharmacy and Therapeutics—O. T. Osborne, New Haven, Conn.; A. B. Lyon, Detroit, Mich.

Nervous and Mental Diseases—Harold N. Moyer, Chicago; H. A. Tomlinson, St. Peter, Minn.

Obstetrics and Diseases of Women—William H. Humiston, Cleveland, Ohio; Lewis S. McMurtry, Louisville, Ky.

Ophthalmology—H. V. Würdemann, Milwaukee, Wis.; J. A. Lippincott, Pittsburg, Pa.

Physiology and Pathology—William A. Evans, Chicago.

Practice of Medicine—W. Britt Burns, Memphis, Tenn.; J. M. Anders, Philadelphia, Pa.

Stomatology—G. V. I. Brown, Milwaukee, Wis.; A. E. Baldwin, Chicago.

Surgery and Anatomy—Arthur D. Bevan, Chicago.

#### GENERAL SESSIONS.

WEDNESDAY, JUNE 11, 7:30 P. M.—SECOND MEETING.

The meeting was called to order by the President. He introduced Dr. Frank Billings, Chicago, who delivered the Oration on Medicine.

On motion of Dr. E. F. Ingals, Chicago, a vote of thanks was extended to Dr. Billings for his instructive and admirable address.

Dr. J. RAWSON PENNINGTON, Chicago, chairman of Committee on Portraits of ex-Presidents, presented the following report:

Mr. President, your Committee has been assiduous in its efforts to secure the portraits of ex-Presidents of the American Medical Association. The responses have been encouraging and lead to the hope that within the next few years the Association will be able to adorn its present home in Chicago with the memorials of those who have given their best efforts to the Association, and whom the Association has in turn honored with its highest office.

Of the several portraits that are in preparation those of Dr. Paul F. Eve, deceased, President in 1857; Dr. Henry O. Marey, President in 1892, and Dr. James F. Hibberd, President in 1894, have been received, and will now be formally presented to the Association by gentlemen who have been selected for this purpose.

#### Presentation of Portrait of Dr. Paul F. Eve.

Dr. Lewis S. McMurtry, Louisville, Ky., said:

Mr. President: It has been a custom of our profession since the earliest times to preserve some personal memento of those whose labors have enriched medical science. In the archives of the medical societies of London, Edinburgh, Paris and other centers of medical learning will be found the portraits and papers of the immortals of our profession. It is a

most worthy custom. In our American Hall of Fame it is eminently appropriate that a conspicuous place be conceded to the portrait of Paul F. Eve, of Nashville, Tenn. A great teacher and practitioner of surgery, he advanced the knowledge and molded the practice of the American profession in the middle decades of the nineteenth century. He labored incessantly with tongue, pen and scalpel to enrich the fund of scientific knowledge and to promote its diffusion among American physicians and surgeons. He was modest; he was gentle and kind; he was brave and true, and imbued throughout his career with one earnest purpose—to advance science and mitigate suffering. He was the tenth President of the American Medical Association and presided over its deliberations in 1854. Of his numerous valuable contributions to medical literature, his work entitled "Remarkable Cases in Surgery" will ever remain among the choicest of medical classics. His life was an unbroken series of laborious years. His name and fame are perpetuated in his old home by his two distinguished sons, Drs. Duncan and Paul F. Eve, of Nashville, Tenn., both eminent teachers and practitioners of surgery. [Applause.]

#### Presentation of Portrait of Dr. Henry O. Marcy.

Dr. W. A. Evans, Chicago, said:

*Mr. President, Ladies and Gentlemen:* It is proper that, a better organization accomplished, we pause and look back over our career since its somewhat nebulous beginning in this state more than half a century ago. It is not only proper, but wise, for hope, for posterity lies close to pride of ancestry. When the children of Israel looked from the mountains into the promised land they gave some time to the consideration of the way along which they had come. We have been a great, wild, loose force and many master minds have worked to co-ordinate us. Amongst those who have labored to convert these possibilities into potentialities is a certain ex-President, born in New England in 1837. Whilst he was born in New England, he was also born of New England. The race finding incentive to do in the difficulties that the land presented, such environment has taught them that no opposition is insurmountable. He has found more than the usual lot of opposition; it has only served to goad his endeavor. A great scientist, yet a good citizen; a forceful organizer, yet a human man, and a Christian gentleman; one wishes to say to him as said Ruth to Naomi: "Whither thou goest, I will go; thy people shall be my people, and thy God my God."

Ladies and gentlemen, in behalf of his family and friends, I present you this portrait of your President in 1892, Henry O. Marcy, of Boston. [Applause.]

Dr. Marcy, being present, was called for, and made one of his happy speeches.

#### Presentation of Portrait of Dr. Hibberd.

Dr. Charles A. L. Reed, Cincinnati, spoke as follows in presenting the portrait of Dr. James F. Hibberd:

The task that has been imposed upon me by your Committee is exceedingly agreeable, because it gives me an opportunity to speak, not only of a venerable and venerated friend, but one who must be accepted as the highest type of our profession—a general practitioner. He came of a worthy lineage and in his veins courses the blood of a meek people, who, landing on the shores of the Delaware, said to the red man: "Peace to thee and thine." It was well on to a century ago that he was born; it was in 1816, in the historic county of Frederick in Maryland. And when he attained his youth he was sent down the Potomac to the beautiful city of Alexandria, there to study under the shadow of the Capitol and amid scenes hallowed by footprints of patriots. Thence, a little later, he for a year strolled beneath the elms and breathed deeply the academic atmosphere of old Yale; and before the century had run half its course he won his doctorate in medicine from that great institute of learning, the College of Physicians and Surgeons of New York. His professional career began in the great forest, now no more, but that then stretched vast and verdant and ombrous from the Allegheny mountains to the prairies. During the period of his residence in this part of what is now the Middle West, he showed that he was more than a mere doctor by serving three years in the Ohio Legislature. For a year he sailed the high seas, a surgeon on a ship. Then came the Mexican war, followed by the acquisition of California, and we find the young doctor, the young legislator, in the added rôle of the Argonaut. There on the golden strand of the Pacific he is discovered giving his beneficent skill to the hardy pioneer, and with his broad humanity and his great intelligence helping to fashion the splendid society that to-day adorns our western metropolis. After seven years of this experience he returned again to the Middle West and found congenial life where the Friends had

gathered from the East and from the South and had built a college and around it a city. But the quietude of this life was soon interrupted by a call to professional labors in that great institution of learning, the Medical College of Ohio, now the Medical Department of the University of Cincinnati. It was the beginning of the "sixties," and into that lecture room there came a discordant note—it was the first alarm of that fratricidal strife that presently convulsed the country. There was no hesitation. The blood of them that fashioned the Republic now coursed with militant impulses through the veins of the Quaker. The office, the lecture room, home itself were deserted for the long march, the bivouac, the hospital, the field of carnage—for Stone River and Murfreesborough, and there gave of his own blood to the vicarious offering on the altar of Liberty and Union. But when peace again came with its blessings, the doctor, the legislator, the Argonaut, the traveler, the soldier, returned to the quiet pursuits of his profession, only to be rewarded by the organized profession of the great state of Massachusetts with a prize for an essay. It was on "The Part Taken by Nature and Time in the Cure of Disease," and in diction and research and advanced thought it was worthy a Sydenham and a Hilton.

But the doctor was still something more than a doctor; he was the leading citizen of his city, over whose interest he was elected to preside as chief executor and guardian of those about him; he protected them by administering the health laws of his state within his county for the long period of eighteen years. But in the midst of all he went to the societies and wrote articles able and strong. The University of his state, seeing his work, invested him with the Doctorate of Laws, and then, nine years ago, this Association, the organized body of the profession he yet honors and loves, laid its laurel wreath upon his brow. There was a certain charm in the fact that after more than forty years the humble Argonaut of '49 should return to the Golden Gate laden with the most conspicuous honors of his profession. And now, in the enjoyment of a peaceful old age, with faculties all alert, this father—no, this elder brother of ours, sends his greetings to a reunited profession. I now have the pleasure of lifting the veil from the portrait of James Farquhar Hibberd, of Richmond, Ind. [Applause.]

Dr. William A. Evans moved that the portraits be received and the committee continued. Carried.

#### THURSDAY, JUNE 12, 7:30 P. M.—THIRD MEETING.

Dr. J. M. Emmert, Atlantic, Iowa, delivered the Oration on State Medicine. A vote of thanks was extended to Dr. Emmert for his address.

#### FRIDAY, JUNE 13, 12 M.—FOURTH MEETING.

The General Meeting was called to order by the President.

The Secretary presented a summary of the proceedings of the House of Delegates, including the officers elected for the ensuing year.

The next business in order was the installation of officers. The retiring President, Dr. Wyeth, said: "The King is dead; long live the King! I introduce to you your new President, Dr. Frank Billings of Chicago." [Applause.]

Dr. Billings, in accepting the Presidency, said:

I can not express in words my feelings at this moment. I would that words could express what my heart feels! I have had conferred upon me what I consider the greatest honor in the gift of the medical fraternity of America. There is no greater body of men and women than the members of the American Medical Association, and to be chosen President of such an organization should be the fulfillment of the ambition of any man. Again, this position has been held by some of the most eminent men of this country. When one follows these eminent men, it must be a source of pride, and it is to me.

The reorganization of this Association, which occurred last year, has had its successful beginning at this meeting, and the success of this meeting is due, in great measure, to the earnest work done by him who has preceded me. He has set a pace, a mark, for me to follow. Without your help I can do nothing. With it I can carry on, with the aid of the great men in this Association, much. I therefore bespeak your help. [Applause.]

Dr. Foshay offered the following:

*Resolved*, That when we adjourn this meeting, we adjourn to meet in the library room, 103 State Street, Chicago, Monday, June 16, at 5 p. m.

*Resolved*, That at such adjourned session no business shall be transacted excepting ratification of the work heretofore done.

On motion the resolutions were adopted.

Adjourned.

## Societies.

### COMING MEETINGS.

Medical Society of New Jersey, Atlantic City, June 24-26, 1902.  
Washington State Medical Society, Tacoma, June 24-26, 1902.  
Michigan State Medical Society, Port Huron, June 26-27, 1902.  
Medical Association of Nevada, Virginia City, July 7, 1902.  
American Ophthalmological Society, New London, Conn., July 16, 1902.

**Caldwell County (Mo.) Medical Society.**—The physicians of the county met at Kingston, June 2, and organized a medical society, with Dr. Benjamin F. Carr, Polo, president, and Dr. William Shouse, Kingston, secretary.

**Albert Lea District Medical Society.**—The third annual meeting of this Society was held in Albert Lea, Minn., May 20. The following officers were elected: Dr. Albert C. Wedge, Albert Lea, Minn., president; Drs. Peter H. Vesterborg, Forest City, Iowa, William L. Palmer, Glenville, Minn., and Ferdinand A. Christensen, Lake Mills, Iowa, vice-presidents; Dr. Hamilton H. Wilcox, Albert Lea, Minn., secretary, and Dr. John P. von Berg, Albert Lea, Minn., treasurer.

**Chickasaw Medical Association.**—This Association, at its fifth semi-annual session at Ardmore, I. T., May 22, elected Dr. James W. Gilbert, Roff, president; Drs. John R. Runyan, Ada, H. P. Wilson, Wynnewood, and John W. Smith, Ardmore, vice-presidents, and Dr. Edgar E. Chivers, Earl, secretary and treasurer, and discussed the recent act of the Chickasaw legislature requiring all physicians of this nation to be examined before a medical board appointed by the governor, and for such examination to pay a fee of \$25, but action was deferred until the legality of the law could be inquired into. Wynnewood was selected as the next place of meeting.

**Arizona Medical Association.**—The tenth annual meeting of this Association was held in Tucson, May 28 and 29, under the presidency of Dr. Hiram W. Fenner of that city. The following officers were elected: Dr. William Duffield, Phoenix, president; Drs. William V. Whitmore, Tucson, Arthur W. Oleott, Tucson, and Logan D. Dameron, Phoenix, vice-presidents; Dr. Charles H. Jones, Tempe, secretary, and Dr. William N. Bell, Wickenburg, treasurer. The Association will meet next year in Phoenix. It has adopted the rules and by-laws of the American Medical Association, making eligible to membership all regular physicians who do not classify themselves under creeds. The tendency in this Association is to unify the practice of medicine.

**Association of Surgeons of the Southern Railway Company.**—The seventh annual meeting of this Association was held in Washington, D. C., June 5, 6 and 7, Dr. Thomas H. Hancock, Atlanta, Ga., in the chair. In his address, the president advocated a strict physical examination of every employe of the road and asserted that a mere examination of employes for color blindness and deafness was not sufficient, but that every muscle and organ of each man should be subjected to a thorough inspection. The following officers were elected: Dr. Rhett Goode, Mobile, Ala., president; Drs. T. P. MacMahan, Illinois, and Matthew W. O'Brien, Alexandria, Va., vice-presidents, and Dr. J. J. Harrison, London, Tenn., secretary and treasurer. The next convention will be held in Old Point Comfort, Va., in June, 1903.

**American Laryngological, Rhinological and Otological Society.**—The eighth annual meeting of this Society was held in Washington, D. C., June 2, 3 and 4. The opening session was held at the Cosmos Club, when an address of welcome was delivered by Surgeon-General George M. Sternberg of the U. S. Army. In his presidential address Dr. Charles W. Richardson, Washington, deplored the superficial preparation of many young men who begin the practice of specialties, and urged that the fellows of the Society do all in their power to encourage the thorough education of persons who are to take up some specialty. He said that general practice is the best possible preparation for men who desire to specialize, and deplored the tendency of young physicians to take up some special branch of medicine or surgery before they have acquainted themselves thoroughly with general practice. The election of officers resulted as follows: Dr. Joseph A. Stucky, Lexington, Ky., president; Drs. Marshall R. Ward, Pittsburg, Pa.; Lewis C. Cline, Indianapolis, Ind.; Dunbar Roy, Atlanta, Ga., and Patrick F. Gildea, Colorado Springs, Colo., vice-presidents and chairmen of sections; Dr. Wendell C. Phillips, New York City, secretary, and Dr. Ewing W. Day, Pittsburg, Pa., treasurer. The next meeting will be held in Lexington, Ky. The Society was received by President Roosevelt on the afternoon of June 3, and

the annual banquet was held at the New Willard on the evening of the same day.

### AMERICAN ACADEMY OF MEDICINE.

*Twenty-Seventh Annual Meeting, held at Saratoga Springs, N. Y., June 7 and 9, 1902.*

The President, Dr. V. C. Vaughan, Ann Arbor, Mich., in the Chair.

#### Medical Licensure.

A proposition to amend the constitution whereby the payment of the sum of \$20 at one time would free a member from the payment of any subsequent annual dues was carried.

DR. EDWARD JACKSON submitted the report of the Committee on the Investigation of Reciprocity in Medical Licensure, which is identical with the report of a similar committee to the American Medical Association given in this issue. This report was referred to the council.

The report of the secretary on the "Results of the Examinations for Medical Licensure for 1901," which was next given, was a tabulation of the examinations before the various state boards of medical examiners arranged in each state by colleges showing the number passing and the number failing in each college, and under each college showing the number of graduates of that college passing or failing in each state.

"The Personal Equation in Marking Examination Papers," by Dr. Charles McIntire, gave some facts to determine the validity of objections to reciprocity. A series of questions, with their answers, selected at random and from students of various systems of practice, were submitted to a number of examiners. The paper tabulates the results of the markings.

DR. VAUGHAN said that it was gratifying that the markings by the state examining boards and the colleges were so close. Much was heard of the charge that the state boards are more exacting and try to cut down the number of those entitled to practice medicine on the "trades union" line, but here was shown a tabulation showing that the marks of the state boards were fully as liberal as those of the colleges.

#### Alcohol Not a Food.

The afternoon session was opened by the paper of Dr. Knopf of New York on "The Family Physician of the Past, Present and Future." The paper incidentally referred to alcohol, and a warm discussion arose as to whether it was to be considered a food.

MR. TAYLOR, of the Board of Regents of New York, said that in a recent discussion the views of Professor Atwater of Wesleyan University were diametrically opposed to those of Mrs. Hunt, a leader of the Women's Christian Temperance Union, and he desired to know the judgment of the academy.

DR. DIDAMA said he had been present at the discussion referred to by Mr. Taylor. The majority of those who favored Professor Atwater's views were teachers who felt that they had already too many studies to teach, and did not want to add to them the teaching of temperance and physiology. Professor Atwater's statements had been answered by Mrs. Hunt. Quotations had been made from some of the most prominent authorities from abroad and Professor Atwater had gone away with the opinion of the people against him—except some of the teachers who wanted to teach less and some who themselves wanted to drink.

DR. W. S. HALL said the whole matter rested on the definition of a food. If we define a food as a substance which is oxidized within the body, then there is nothing more to say about it. Because a substance possesses characteristics similar to another substance, it is not justifiable to conclude that it is to be classed with that other substance. It is not until we take into consideration the whole influence of alcohol that we see the many reasons why it should not be classed as a food.

This discussion led to a resolution by Dr. Cross that in the opinion of the academy alcohol should not be classified among alimentary substances. The report of the council on Monday was that the question, not being one of medical sociology, did not lie within the province of the academy and that it be laid on the table.

### The Physician as an Accountant.

DR. C. M. CULVER of Albany read this paper and said that if the physician's bookkeeping were carefully done there would be more ability to press toward the real aim of his high calling. Slovenliness in bookkeeping was almost as unpardonable as the same quality in linen.

"Pure Science vs. Applied Science in Medicine" was read by Dr. Winfield S. Hall of Chicago.

### Combined Liberal Arts Medicine Course.

The report of the Committee on Time Allowance in the Combined College and Medical Course was given by Dr. A. L. Benedict of Buffalo, with statistics gathered from the schools of the country.

Concerning the resolution of Dr. Winfield S. Hall that it is the opinion of the academy that the combined collegiate and medical course should occupy seven years, the council on Monday recommended the adoption of the following resolution: "That it is the sense of the academy that an adjustment can be made between bacca-laureate and medical courses by which the course could be shortened."

In the evening, the president's address, "The Religion of Science," was given by the president, Victor C. Vaughan of Ann Arbor.

### The Medical Profession and Social Reform.

Mr. Edward T. Devine, of the United Charities of New York, read this paper at the Monday session. He believed that physicians should take that part of the general public which had shown an interest in social welfare increasingly into their confidence, and should welcome more emphatically than heretofore the co-operation of the public press, of charitable agencies and public officials, including those who from any point touch officially the living conditions of the masses—clergymen, employers, labor leaders and many others.

DR. DANIEL R. BROWER of Chicago, in the discussion, said that he had been for a number of years an advocate of public lectures by physicians on matters pertaining to sanitary science and, from time to time, as opportunity presented, he had had interviews with newspaper reporters and had otherwise given information on common topics pertaining to the question of preventive medicine, and he did not feel that this was in violation of the code of ethics.

DR. H. A. TOMLINSON, of St. Peter, Minnesota, thought it took a long time for the profession to learn that nothing in the way of reform in regard to social conduct could result, except in so far as the public opinion was educated and demanded it. From his own experience Dr. Tomlinson could not speak with any confidence as to the advantage of newspapers as proper mediums for the dissemination of knowledge on matters of hygiene. He was sure that no one would ever induce him under any circumstances to say a word to a newspaper reporter. He had never known a newspaper report of any medical or sanitary undertaking to be other than the most absolutely contorted and twisted production possible. That which was the most trivial was made the most important and that which was the very essence was entirely ignored.

DR. WALTER L. PYLE of Philadelphia thought the newspaper the most valuable means of dissemination of medicine and hygiene, but he did not think this was best accomplished by a personal interview filtered through the pen of the reporter; rather, that the newspaper should have a medical editor who shall edit or pass censure upon medical matters of direct interest to the public.

DR. P. MAXWELL FOSHAY of Cleveland advocated medical societies having a committee on public health which should consider epidemics when they are present, and other matters of importance and that the results of these considerations shall be published over the name of the medical committee of such and such a medical society. In that way the objection of professional advertising is entirely eliminated and matters pertaining to health are brought into contact with the public in general.

DR. ROSA ENGLEMANX of Chicago believed that a very great amount of good would be wrought by the introduction of these

subjects into the public schools by people fitted for the purpose; that children in the schools should be taught something of the communicability and prevention of disease. Through them this knowledge would reach parents.

DR. W. S. HALL of Chicago spoke of numerous "mothers' clubs" in Chicago which medical men were invited to address; he thought no physician was justified in setting aside such invitations.

### The Political Side of Medicine.

DR. JOHN B. ROBERTS had come gradually to believe that for a doctor to neglect personal attention to civic and political problems is selfish and unjustifiable. The man of education, brains and capability owes a certain part of his day to the community in which he lives and to association with which his personal success and happiness are due. If he does not give it he is not doing his full duty to mankind. The greater the advantages he possesses the greater the call to serve God by serving man. Few men, as a class, have greater personal capacity than physicians. Few, then, owe more to the state, Time, he said, may be required to convince the community that sanitary plumbing, pure water and compulsory vaccination pay. Men of lower ideals may deny that official dishonesty and public indecency sap the vigor of a village or town and inevitably lead not only to higher taxes, but also to diminished personal safety. It may not be clear to all his fellows that widespread education of the young and systematic beautification of towns and cities attract desirable residents, raise the value of property and increase the happiness of all.

The belief was entertained that the American Medical Association would exert a more potent influence than it has in state and national politics, as since its reorganization it is much better fitted to make its wants known and to have its advice sought and heeded. Its Committee on National Legislation, which meets yearly at Washington, was mentioned as an instrument of increasing competency.

The Monday afternoon session was opened by the reading of the paper of Dr. D. C. Hawley of Burlington, on "The Relation of the Physician to Politics."

### Compensation for Medical Services Rendered the State.

DR. T. D. DAVIS of Pittsburg believed there was no reason for the inadequacy of pay except that physicians underrate their own services. There is no remedy except through the profession itself.

### Medical Representation in Hospital Management.

DR. AUGUSTUS A. ESHNER of Philadelphia said that the physician is by reason of his training, his attainments, position and his relations with others, especially fitted for hospital management. Medical representation on hospital boards can be given (1) by electing one or more members of the staff to membership on the board; (2) by periodic conferences between the staff and the board; (3) by conferences between a committee of the staff and the board or a committee of the board.

DR. P. MAXWELL FOSHAY believed that the physician could take an active part in a portion of politics with benefit to himself, the profession and the community. The damage which comes from entering politics comes, he said, from the motives with which one enters.

DR. ESHNER assented to Dr. Roberts' proposition in that a medical man is first a citizen and secondarily a physician; and, that inasmuch as the administration of civic affairs constitutes an important phase of politics, it seemed to him that it was the bounden duty of the physician to participate in these affairs, and therefore, to participate in politics.

### May Hospitals Steal?

DR. P. MAXWELL FOSHAY of Cleveland in this paper related an instance of a hospital surgeon innocently operating without charge on an employe of a large corporation whose surgeon had offered to do the work for a good fee. Employing corporations, he said, were learning to reduce fees by putting employes in hospital wards where physicians give their services free of charge, thus robbing the profession of some income. He believed it was suicidal to allow the custom to go unchecked. Hospitals should adopt adequate means for rigidly investigat-

ing the ability to pay fees of those who ask for treatment or medicine or the profession would become thoroughly disorganized.

"Good Vision as a Factor in the Educational Process" was the title of a paper read by Dr. S. D. Risley.

#### State Aid for Medical Schools and Hospitals.

DR. CHARLES MCINTIRE of Easton in this paper gave in tabulated form a statement of the custom of each state in making appropriations for hospitals and medical schools.

#### Children in Cities.

DR. ROSA ENGLEMANN of Chicago spoke of the children of the poor in cities as of paramount interest, since the submerged fourth (not tenth) live "below the poverty line." Children of the poor, America's future citizens, unless given full opportunity for moral, physical and mental development will become a menace to the integrity of the state. Need of industrial education to fit for useful and lucrative service was urged. School assembly halls as civic and social centers eventually would care for neighborhood wants, such as public baths and small parks.

#### New Officers.

The Nominating Committee reported the following nominations which were adopted unanimously: President, Charles McIntire, Easton; vice-presidents, William R. White, Providence, R. I.; George Dock, Ann Arbor; Rosa Englemann, Chicago; and D. C. Hawley, Burlington, Vt.; secretary, A. R. Craig, Columbia; treasurer, Edgar M. Green, Easton; assistant secretary, John S. Davis, University of Virginia.

### AMERICAN GYNECOLOGICAL SOCIETY.

*Twenty-seventh Annual Meeting, held at Atlantic City, N. J., May 27-29, 1902.*

*(Continued from p. 1590.)*

President, Seth C. Gordon, M.D., Portland, Maine, in the Chair.

#### Non-Operative Treatment of Retrodisplacements.

DR. F. H. DAVENPORT, Boston, read a paper with this title, taking up three points: First, the methods of non-operative treatment; second, the indications for their employment, and, third, the results.

The only important method of non-operative treatment is that by pessary. Twenty-five years ago it was practically the only method, and for that reason it was developed to a remarkable degree, not only as regards the variety of displacements, but also the numerous forms of pessaries devised for their relief. Massage, electricity and general tonic treatment can not properly be called methods, but are merely adjuncts. The choice, then, lies between treatment by operation and that by pessary. With the development of surgical procedures, that by supports was thrown into the background and neglected. There are cases, however, which are well adapted to the pessary treatment. Such are, first, cases of simple retroverted uterus without complication, which have presumably lasted only a short time; second, retroversion following childbirth; third, cases complicating neurasthenia as a result, where operation is inadvisable until the patient's health is built up.

The pessary treatment is not applicable to cases in young girls where local treatment of any kind is inadvisable, to cases complicated with lacerations, or to cases of long-standing, where secondary changes in the circulation of the uterus have followed. Many of these which should be operated on retuse operation and choose the pessary. What, then, are the chances of cure? The author's own statistics have shown that of all cases treated by pessary, about one-third are cured either anatomically or symptomatically by the use of a pessary for from one to two years. In selected cases the showing would be far better. Such success, however, presupposes close study of the case, care in the selection of the pessary and constant supervision while it is worn.

The only displacements which need correction are prolapse and retrodisplacements, and the latter may be usually corrected by one of two varieties of pessaries, the Langford and the Albert

Smith. The treatment by pessary, therefore, while it should be scientific, is simple.

#### The Alexander Operation.

DR. CLEMENT CLEVELAND, New York, in a paper on this subject described the Alexander operation in detail. Although usually performed for retrodeviations of the uterus, he has found it useful in the cure of forward displacements. The selection of cases, however, is very important. In cases where adhesions exist, it is better to follow some of the other methods or resort to the vaginal route. In cases where the Alexander operation is not indicated, he prefers the operation devised by Dougal Bissell, and styled by him "internal shortening of the round and broad ligaments," with which the writer has had many good results.

To obtain the best results from the Alexander operation, a pessary should be worn before, and for two months after, the operation. It is also advisable that the patient should wear one for a few months after confinement. The patient should be kept in bed for three weeks after the operation, and the dressings should be changed daily. The main point in the performance of this operation is to reach the external ring with a clean cut from the surface. To a beginner the great stumbling-block is the mistaking the superficial fascia for the aponeurosis of the external oblique. The Doctor believes that by including in the first suture the pouch of the peritoneum or infundibuliform process, it not only strengthens the attachments of the ligaments, but adds to the support of the uterus. Sterilized iron-dyed silk is recommended to hold the ligaments.

Hernia, as a result of this operation, is rare, and when met is due either to faulty technic or suppuration. The chief causes of failure are, 1, suppuration in the wounds, and 2, the too tightly tying of the ligament sutures.

In comparison with other methods, the writer prefers the Alexander operation for an uncomplicated case of displacement. In his opinion, the vaginal method of operation should be confined to women who have borne children.

#### Suspension of the Uterus.

DR. HUNTER ROBB, Cleveland, Ohio, in speaking of the advantages, disadvantages and results of suspension of the uterus, insisted that suspension and fixation are not interchangeable terms, the latter procedure being always undesirable. Before we are able to speak with certainty as to the results we must have more accurate data, which can only be obtained by a more rigid classification and a subsequent analysis of sufficiently larger series of, 1, uncomplicated cases of malposition; 2, those cases of malposition in which other pathologic conditions are present, but in which the malposition is the indication for operation; 3, those cases in which the suspension is only a supplementary operation.

Robb believes that in suspension we have a method of permanently relieving a large percentage of patients suffering from obstinate retroflexion. Difficulties in future pregnancies are mainly the result of fixation operations and not of suspension. Hernias, adhesions and localized or general sepsis are due to faulty technic and should not occur.

#### Intra-Abdominal Shortening of the Round Ligaments per Vaginum for the Cure of Retrodisplacements.

In a paper with this title, DR. J. RIDDLE GOFFE, New York, said that gynecologists are uniformly agreed that the ligament which serves the most important functions in supporting the uterus is the sling of tissue reaching from the promontory of the sacrum, known as the utero-sacral ligaments, to the posterior wall of the cervix, plus the utero-vesical ligament reaching from the anterior wall of the uterus to the symphysis pubis. This is reinforced by the cellular tissue and ligamentous structure in the base of the broad ligament. So long as the utero-sacral ligaments retain their proper tone and length, swinging the cervix high in the hollow of the sacrum, retroversion of the uterus is impossible. It is for some malign influence affecting the utero-sacral ligaments, therefore, that we must look for the cause of retrodisplacements of the uterus, and it is consequently to the repair or the recovery of function

in the utero-sacral ligaments that we must look for restoration to normal condition. Unless the indirect result of any operation for maintaining the uterus in its normal position is to enable the utero-sacral ligaments to involute and recover their tone and sustaining power, that operation becomes a failure. That this can be secured by direct operative procedure upon the utero-sacral ligaments themselves, he is convinced from experience.

The next most favorable tissue to utilize for this purpose is the round ligament. This is attested by the results secured by many operators upon the round ligament in various ways. Alexander and others have demonstrated that the round ligaments, when shortened at the external abdominal ring, are efficient in maintaining the uterus in its normal position when applied to cases of retrodisplacement uncomplicated by inflammatory process. Olshausen has shown that the round ligaments when caught up near to the uterus and attached at the edges of the abdominal incision are efficient and satisfactory in restoring the uterus to its normal position. Wylie, Mann, and many of their followers have had complete satisfaction in simply doubling the round ligaments upon themselves and stitching them in that position through an abdominal incision. Dührssen, Wertheim and Vineberg have presented most conclusive statistics bearing upon the entire efficiency of shortening the round ligaments through the vaginal incision by catching them up near the horns of the uterus and stitching them to the anterior vaginal wall. The same German operators, Dührssen, Wertheim, etc., and in this country Byford and the essayist attest to the equal efficiency of operating through the anterior vaginal fornix, and doubling the ligaments on themselves in accordance with the Wylie-Mann suggestion. He had not found a method which had given him such universal satisfaction as this. He reported 130 cases that he had subjected to this procedure during the past sixteen years, and he knew of only three failures, and these were due to some departure from the regular procedure in which a modification was attempted. Among these cases ten are known to have become pregnant and eight have gone to full term, the pregnancies resulting most comfortably and satisfactorily, the uterus retaining its proper position thereafter. Of the miscarriages, one was in a syphilitic negress, and in the other the cause could not be learned.

The superiority of this method over others depends, therefore, upon the general question of the value of the vaginal route of attack over the abdominal route, and the incomparably wider field of application as compared with the Alexander operation.

Among his cases he finds six of congenital retroversion in young, unmarried women, whose ages ranged from 19 to 27 years. In these cases, although the vagina was small and the hymen intact in all of them, he was able to perform this operation and effect a complete cure in all.

#### Operation on the Utero-Sacral Ligaments in the Treatment of Retroversion.

DR. J. WESLEY BOVEE, Washington, D. C., said that the first operation for shortening the utero-sacral ligaments through the vagina was done by him June 28, 1897, and since that time he has had seven other cases, all successful. By the abdominal route he began shortening these ligaments Feb. 21, 1900, and since then on three other occasions has the operation been done.

The method of shortening these ligaments through the vagina, as he has planned and practiced it, is to place the patient in the extreme lithotomy or Simon's position, and with a self-retaining perineal retractor in place, the posterior lip of the cervix is grasped with a vulsellum forceps and drawn forward. An antero-posterior incision is made through all the structures of the posterior vaginal fornix, except the peritoneum, and extending approximately from the cervix to the rectum. By careful dissection the ligaments are brought plainly into view. Then, grasping one of them with a forceps midway between the extreme points to be united and lessening the traction on the cervix at the same time, the fold of the ligament is brought down into the vagina; then a curved needle, armed with kangaroo tendon, is passed through the

ligament at the extreme points noted and another through the loop thus formed and through the posterior portion of the cervix below the insertion of the ligaments. When the other ligament has been treated in a similar manner, the two deep sutures are tied, and then the others. The wound is now spread well open and the two ends of it approximated by a continuous kangaroo tendon suture. When the wound is closed it appears to have been originally a transverse one. Sometimes he has modified it by separation of the anterior vaginal wall from the uterus and converting the wound into a longitudinal one or by transplanting the wall higher on to the uterus. When adhesions have been thought to exist in the retro-uterine space, the cul-de-sac has been entered and the adhesions separated. In all instances he has shortened the round ligaments through the anterior fornix.

By the abdominal route the plan he has followed is to use the Trendelenburg position, remove the intestine and omentum from the pelvis, and by the use of a special long retractor hold the uterus and appendages well forward and upward. Then, tracing the utero-sacral ligaments with the fingers to properly locate them, a longitudinal incision is made through the peritoneum near the inner margin of one of them. The ligament is then partially dissected loose and is treated much as by the vaginal route. The peritoneum is closed by a purse-string suture, or by the plan of closing the vaginal wound. The other side is treated similarly and the abdomen closed. He has in a few instances shortened the round ligaments at the same sitting. The results of the various operations for shortening the utero-sacral ligaments were given.

As to the advantages of the operation, the extraperitoneal shortening of these ligaments, with the adjoining portion of the vaginal wall, is practically devoid of danger, and is frequently indicated. The abdominal route is less frequently required. Yet, with the abdomen opened, perhaps for some other purpose, shortening of these ligaments would be very little extra risk to the patient, or an extra tax upon the part of the surgeon. It does not have the same conditions incident to ventrosuspension and ventrofixation which are considered by some as real dangers, and it is supporting nature's supports to this important reproductive organ.

#### A Further Contribution to the Study and Practical Significance of Lactation Atrophy of the Uterus.

DR. HIRAM N. VINEBERG, New York, read this paper. Although the writer six years ago drew the attention of the profession to lactation atrophy the subject has not yet received the consideration that it deserves, as is evidenced by the literature and the recent text-books on obstetrics. It is a physiologic process accompanying lactation, with or without amenorrhea, the atrophy or superinvolution being temporary only, the return to the normal size being in some cases dependent upon the cessation of lactation. In others, again, the regeneration of the uterine tissue occurs while lactation is still going on. It is not to be confounded with what is commonly known in this country as hyperinvolution, which is usually permanent in its character, although in some rare cases it terminates in this form. While the author has seen during his ten years' service at the dispensary over five hundred cases of lactation atrophy, he has not met with more than twenty cases of permanent hyperinvolution.

When the atrophy is slight and is manifest only by a thinning of the uterine walls, it is known as "eccentric atrophy," when it is more marked, as is evidenced by a marked diminution in the size of the uterus, the term "concentric atrophy" is employed.

The cervix usually participates in the atrophic process, but the ovaries do not, as a rule. The hyperinvolution or atrophy is fully established between the eighth and twelfth week, and persists for a variable period in ammenent nursing women, its persistence usually being dependent upon the continuance of lactation. Anemia does not play an important rôle in the causation of the condition, as has been stated by some writers, notably Engström. The author had the blood examined in a series of cases and he found that the degree of atrophy bore no relation to the diminished number of red blood cells and to the

lowered percentage of hemoglobin. Cases with the smallest uteri had the highest number of red blood cells and the highest percentage of hemoglobin.

Hyperinvolution may occur independently of lactation, as shown by Hansen and P. Müller. Most writers hitherto have concerned themselves chiefly in showing that lactation atrophy is not an injurious condition, and that it seldom leads to permanent atrophy. But the writer drew attention to its decidedly beneficial effects upon the uterus in bringing about a normal hyperinvolution. Women, therefore, who nurse their babies are rarely the victims of subinvolution, with its usual sequel, chronic metritis, one of the most unsatisfactory and rebellious conditions to treat. When, as is usually the case among the better classes, the mother is unable or disinclined to nurse her baby, it is the duty of the attending obstetrician to keep the parturient under observation and treatment until nearly the same degree of hyperinvolution is established as obtains in lactation. This period will seldom be less than eight weeks and frequently will extend to three months. Unfortunately, the importance of this desideratum is very generally not recognized. The accoucheur rarely considers it necessary to examine the parturient after the second or third week.

In concluding, the writer drew attention to a peculiar circumstance, that in the class of women from whom he draws his material in dispensary practice uterine cancer is exceedingly rare. From the fifteen hundred to sixteen hundred new patients he sees yearly, not more than one or two are the victims of cancer of the uterus. One would expect almost the opposite if improper attendance during the puerperium and lacerations of the cervix play any rôle in the causation of that dread disease. He asks the question whether the circumstance that these women are shielded, in a great measure, against the occurrence of chronic metritis, renders them less susceptible to the development of uterine cancer?

#### President's Address.

This was delivered by Dr. Seth C. Gordon, Portland, Me., on "The Relation of the Gynecologist, Obstetrician and General Surgeon." He said it was the custom of late years to say that gynecology had passed its usefulness, and had become merged into general surgery, and that there no longer existed the necessity for attempting to prolong the life of this hopelessly-doomed department of medicine. With this proposition he took issue, and maintained that until modern obstetrics approached more nearly to the ideal standard, there would be a large field for the gynecologist proper. Scientific gynecology had its birth in America, and was founded by Marion Sims. No gynecologic surgery prior to his day had made any impression on surgical practice that had endured until the present time. That which the keen, brilliant genius of a Sims made possible, the intelligent, patient, practical common sense of an Emmet made probable to every afflicted one of womankind. The field was wide and from all parts of the country came the sufferers from childbed injuries, many of which were due to faulty obstetric work of that day. Among the causes were long-delayed use of the forceps, careless and needless use of forceps, a disregard of the accidents occurring, and a total lack of aseptic precautions during the progress of labor. From the first came vesico-vaginal fistula; while from the second came lacerations of the uterus and perineum, many of which could have been remedied had the accoucheur regarded them at all, and treated them according to the best-known surgical principles. The great fault lay in entirely ignoring such accidents.

There were many faults yet to be overcome in the practice of obstetrics before the millenium shall dawn for the gynecologist. While public institutions are doing good work in eliminating germ diseases, and bringing the mortality almost to the vanishing point, much missionary work needs be done among professional men in private practice.

The criticisms he offered were: 1. The too early use of the forceps. When the pendulum began to swing from rarely using the forceps, it went to the opposite extreme, using them far too often. A very large majority of cases will, if left alone, terminate naturally. 2. Cases of accidents occurring in labor are not properly repaired at the time.

The fashion of late seems to be to prohibit antiseptic douches after labor. While it may be necessary in normal labors, with no accidents, lacerations should be kept surgically clean, and it can be done only by frequent irrigation and germicides. Surgical cleanliness on the part of the accoucheur and patient from the beginning of labor until convalescence, insure safety to one and duty well performed on the part of the other.

As an additional safeguard against laceration of the perineum, he believes the timely use of anesthetics invaluable. It prevents the use on the part of the patient of the voluntary muscles, which do much to cause this accident. His preference as an anesthetic is the A. C. E. mixture, given only during pains. It acts promptly, and does not excite the patient.

Post-partum hemorrhage is not due to the use of an anesthetic, but to the carelessness of the attendant. A steady, careful, persistent manipulation of the uterine tumor during the expulsion of the child and placenta, and continued until firm contraction is produced, insures safety in almost every case. His own experience fully justifies him in making the assertion that a strict observance or adherence to this rule will nearly always prevent post-partum hemorrhage.

Modern methods of Cesarean section had given such good results in diminishing mortality, that the barbarism of craniotomy had practically ceased, and the morbidity which furnished such abundant gynecologic material had correspondingly decreased. This great progress was practically due to anesthesia, asepsis and improved technic, and for this credit should be given to gynecologists who had perfected the operative details of abdominal section, made possible by the discovery of anesthetics and clean surgery.

Laceration of the cervix, especially of long-standing, was not always an indication for trachelorrhaphy, destruction or extreme atrophy of tissue of the cervix being a decided contra-indication to the operation. Thousands of women suffered much more after trachelorrhaphy than before. The cervical canal was closed too much, drainage prevented, and often infection developed in the uterus and tubes, and the last condition was much worse than the first. Emmet never taught such gynecology as that. He did not even teach that all lacerations of the cervix required an operation. On the contrary, he believed that many of them did not require any interference, simply because they were not producing any morbid symptoms. The tendency had been too much in the direction contrary to Emmet's teaching, with the result that gynecology had been brought into disrepute. Many symptoms attributed to laceration of the cervix had been found to be due to disease of the other pelvic organs.

The plastic operation of perineorrhaphy, so often done by the general practitioner, to say nothing of the general surgeon, was far too often apologetic, when compared with the work of Emmet, Thomas, Marcy and others throughout the country.

The best work for malignant disease of the pelvic organs had been done by gynecologists. Probably no man could show better results in the way of relief and even cure of cancer of the uterus than Dr. John Byrne. Whether hysterectomy in any stage of the disease was to be the ideal method was by no means well settled. He believed that a more careful examination and more close observation of women under the care of physicians would detect malignant disease in its earlier stages, at a period when hysterectomy might be the ideal operation.

Much yet remained to be done with plastic operations about the vagina, not only in relation to prolapsed uteri, but for vesicocele, and diseases of the urethra, especially that of caruncle. Incisions into the posterior cul-de-sac for acute inflammatory attacks, whether attended with pus or not, well deserve the attention of the gynecologist. While this was one of the early gynecologic operations for pelvic abscess, without reference to ulterior results, it was now well known that thousands of women could be saved from long and painful illnesses and subsequent hysterectomy by the timely common-sense application of the surgical principle of removing the products of inflammation as soon as formed.

(To be continued.)

## Therapeutics.

[It is the aim of this department to aid the general practitioner by giving practical prescriptions and, in brief, methods of treatment for the diseases seen especially in every-day practice. Proper inquiries concerning general formulæ and outlines of treatment are answered in these columns without allusion to inquirer.]

### Turpentine in Parasitic Skin Diseases.

Dr. L. Leven, according to *Merck's Archives*, employs applications of oil of turpentine in the treatment of pityriasis versicolor and tinea tonsurans. In the first affection a cotton pledget is soaked in turpentine and vigorously rubbed on the diseased skin. This should be done once daily. If the lesions are extensive, only small areas should be thus treated at each sitting. For the second disease the author recommends the use of compresses soaked in turpentine and applied to the affected areas morning and evening. The good results show themselves in a very short time.

### Treatment of Gastric Ulcer.

The following treatment of gastric ulcer recommended by Pariser, appearing in *Med. Standard*, consists in absolute rest in bed as most essential in the treatment. He also recommends a mixture of chalk and talcum, with or without magnesia in place of the bismuth. He finds this mixture fully as effective as bismuth. It forms an aseptic crust over the ulcer. The patient drinks two ounces in a glass of water on an empty stomach and then lies quietly on his back for forty-five minutes.

[The position of the patient is of importance, as the great majority of gastric ulcers occur on the posterior wall.]

### Abortive Treatment of Gonorrhea.

Influenced by the belief that there must be some period in the beginning of an attack of gonorrhea when gonococci lie so superficially that it is possible to destroy them by means of chemical substances without injury to the urethral mucous membrane, Dr. A. Blaschko<sup>1</sup> has for a long time applied himself to the problem of the abortive treatment of the disease. Only those cases are available for such treatment in which the inflammation of the urethra has not existed for more than three days, in which the discharge is not yet abundant and the inflammatory reaction on the part of the urethral mucous membrane is not marked. If viscid pus can be expressed from the urethra and if the mucous membrane is markedly sensitive to the stream of urine, abortive treatment should not be undertaken. The cases most suitable for abortive treatment are those in which a few days after infectious intercourse the patient is conscious in the morning of a sense of tickling or a slightly painful sensation in the urethra and then consults the physician. Serous, turbid or mucoid secretion, perhaps containing a few flocculi of pus, can be expressed from the urethra. Microscopically, numerous pus-corpuseles and epithelial cells are present, with few gonococci and these largely free. Later, the epithelial cells diminish and the pus-corpuseles increase in number and the gonococci are principally contained within the latter. The condition described appears, as a rule, from four to seven days after infection. Cases are to be excluded from abortive treatment in which the morbid process makes such rapid progress that the posterior portion of the urethra is at once involved, as shown by turbidity of the second portion of urine passed in separate glasses. The plan of treatment consisted at first in injecting from 2½ to 3 drams of a 2 per cent. solution of silver nitrate and allowing this to remain for from 20 to 30 seconds, and followed by two syringefuls of sterile water. This procedure is repeated on the second and third days, but with a 0.2 per cent. solution of silver nitrate. The first injection is scarcely, if at all, painful, the subsequent ones but slightly, if at all so, and they are followed by a slight bloody discharge shortly becoming purulent. On the succeeding day pain and discharge will, as a rule, have subsided and in the latter numerous epithelial cells, few pus-corpuseles and scarcely any gonococci will be found. In case of failure to abort the disease the secretion will not subside, or

it increases after a few days' diminution. At a later date, protargol in 4 per cent. solution, albargin in 1 or 2 per cent. solution, or a combination of silver and gelatose were employed instead of the silver nitrate, but these were permitted to remain in the urethra from 3 to 5 minutes and the urethra was not subsequently washed out with plain water. The injection of these solutions may be repeated in the strength named or this may be reduced one-half or one-quarter. Success can be hoped for in about 50 per cent. of properly selected cases.

### Medicinal Treatment of Tuberculosis.

While admitting the value of hygienic measures in the treatment of tuberculosis, Professor Errico de Renzi<sup>1</sup> properly contends that medicinal measures should not be neglected. As he points out, there need be no antagonism between the two, but the one should be made supplemental to the other. From this standpoint he discusses ichthyol, ichthoform and sodium salicylate as having rendered him most valuable service.

Ichthyol was employed especially in severe cases. The most pronounced and almost constant effect was amelioration of the bronchial catarrh, as manifested by diminution in expectoration and partial subsidence of râles. In addition there was progressive increase in weight and improvement in the general condition, with increased arterial tension and without unpleasant secondary effects. If possible, large doses should be administered for long periods of time. The drug may be given in pill-form, but it appears to be more efficacious when given in solution. The following formulæ have proved useful:

|                                      |       |    |
|--------------------------------------|-------|----|
| R. Ammonii sulpho-ichthyolatis ..... | 3vi   | 25 |
| Syrupi limonis .....                 |       |    |
| Syrupi aurantii corticis, āā .....   | 3iiss | 50 |
| Alcoholis, 80 per cent. ....         |       |    |
| Aquæ destil., āā .....               | 3ii   | 60 |

M. Sig.: Take one teaspoonful in water three or four times a day.

|                                      |      |     |
|--------------------------------------|------|-----|
| R. Ammonii sulpho-ichthyolatis ..... | 3vi  | 25  |
| Aq. destil. ....                     | 3ii  | 60  |
| Elix. simplicis .....                | 3vss | 165 |

M. Sig.: One dessertspoonful in a glass of water once or several times daily.

For the first week half a dessertspoonful of the mixture dissolved in half a glass of water was given morning and evening; in the second week this was given four times a day, and so on progressively until from eight to ten dessertspoonfuls were given daily, representing about two drams of ichthyol daily.

Another useful combination is the following:

|                      |       |    |
|----------------------|-------|----|
| R. Ichthyolis .....  | 3iiss | 10 |
| Syr. simplicis ..... | 3v    | 20 |
| Aq. menth. pip. .... | 3iiss | 80 |

M. Sig.: One dessertspoonful in a glass of water in two equal parts.

Generally two dessertspoonfuls may be given at once and the dose be increased daily from two dessertspoonfuls until two drams of ichthyol are taken daily.

Ichthyol may be employed also by inhalation, a bit of cotton saturated with it being introduced into a respirator. It has proved particularly useful in correcting the offensive odor of the sputum.

Ichthoform, a product of the union of ichthyol and formaldehyd, is to be preferred to the former for therapeutic purposes on account of its freedom from taste and odor. It appears in the form of a brownish powder, which is insoluble in ordinary solvents. Its employment is indicated in cases attended with increased elimination of the ethereal sulphates (active intestinal fermentation, coprostasis, ileus, diffuse peritonitis, with intestinal atony or tuberculous enteritis). Ichthoform may be administered in doses of gr. iiss (.09) to gr. v (.30) from thrice to six times daily. Its general effects resemble those of ichthyol, an especially beneficial influence being exerted upon the intestinal derangements so common in cases of tuberculosis, flatulence, intestinal pain and diarrhea being controlled. Sodium salicylate may be employed for the relief of fever. It can be given in doses of 15 grains (1 gm.) from four to six times daily, followed by from six to eight ounces of water.

## Medicolegal.

**Inspection of Laundries a Proper Health Measure.**—The Supreme Court of Louisiana holds, in *City of New Orleans vs. Kee*, that a city ordinance is a health ordinance and constitutional, its expressed purpose being to maintain cleanliness, and to compel laundrymen to use only clean water for washing clothes, and to prevent the employment of persons who have diseases that are contagious, and to prohibit them from washing the clothes of persons afflicted with any contagious or infectious disease. It says that the control and regulation of the laundry business have generally been held to be vested in municipal corporations. And it holds that a reasonable fee, in this case 25 cents, imposed by the ordinance to pay the inspector for his services may properly be charged to the owner of the business, the inspection being made for the benefit of the business itself, as well as in behalf of the public health.

**Communications to Company's Physician Privileged.**—In the case before the Court of Appeals of St. Louis, of *Haworth vs. the Kansas City Southern Railway Company*, it appeared that the party suing, after he had been injured while in the company's employ, was driven to the office of one of its local physicians. The latter examined and dressed the wound, and drove the man to the depot in his own buggy, when he went to the company's hospital at another point. At the trial, the company offered the physician as a witness, and, among other things, counsel asked him what was the result of his examination of the party. This being objected to, counsel offered to prove by the witness that he made an examination of the party suing just after he received his injury; that he made such examination, not as the physician of the party, but as the physician of the company; that the party knew at the time that he was such a physician; and that nothing was discovered but a scalp wound. The witness was permitted to testify that, as the party went away from his office, he did not notice anything wrong about his walking. But the court holds that the judge rightly refused to permit this physician, who attended the party professionally, to testify what he learned while treating him, it being objected to as privileged.

**Use and Criticism of Opinions of Medical Experts.**—The Supreme Court of California says, in *re Blake's estate*, that the law was correctly stated in the following instruction given to the jury: "The law recognizes and receives the testimony of duly qualified medical expert witnesses. Such an expert must, of course, be qualified according to law. A mere opportunity afforded for observation will not constitute a person an expert. He must have been educated in the business about which he testifies, or it must be first shown that he has acquired actual skill and scientific knowledge concerning the subject-matter involved. When such experts are, however, duly qualified, the law recognizes and receives their testimony; and, in arriving at a conclusion concerning the issues involved in this cause [a contest of will case where the mental capacity of the testator was challenged], you may take into consideration their testimony, and award to it such value as, in your judgment, it deserves." But the judge went further, and showed the jury that he had a very poor opinion of testimony of this character. The jury was told that it was unsatisfactory, and the reason why it was so. It was further told that it was unreliable, and the reason why it was so. Not only this, but to make assurance doubly sure, it was told that opinions of experts were not entitled to as much weight as facts, and that such opinions based upon the same supposed conditions were often diametrically opposed to each other. This leads the Supreme Court to state that, while the opinion of the judge might have reasons to support it, it was not proper for him to give his opinion to the jury. Neither was it proper for him to give the jury, in the instruction, an argument as to the reasons why such evidence, in his opinion, was unreliable and unsatisfactory. The Code, it says, makes the testimony of physicians admissible in such a case. The jury may determine whether or not the opinion is reliable. The opposite party is given full opportunity to cross examine, and show the reasons upon which the

opinion is based. He is further given full opportunity to argue before the jury the credibility of such evidence, and of all evidence, and the jury will thus probably arrive at the truth. There is no law that declares that the testimony of experts is unsatisfactory and unreliable. If so, the law should not allow it to be given in evidence.

**Hospital or Trustees Not Liable for Surgeon's Negligence.**—The Supreme Court of Michigan holds, in the case of *Pepke vs. Grace Hospital and others*, that a hospital which is organized and maintained as a charitable institution is not liable for the negligence of its house surgeon in performing an operation. The trustees of the hospital in question it says are laymen. The rules of the hospital provide for a medical board of 25 physicians and surgeons of the city of Detroit, who have charge of all the surgical matters in the hospital. They examine applicants for appointment upon the medical staff, and recommend such appointments to the trustees. The house surgeon charged with malpractice was appointed by the trustees upon the recommendation of the medical board. He was first appointed, after his examination, junior assistant, where he served six months; then senior assistant, where he served another six months. He was a graduate of a medical college of good standing. No complaint whatever was made by any person that he was inexperienced or incompetent. No intimation had ever been made by any one to the trustees that he was incompetent to fill the position. The trustees, who are laymen, the court continues, must naturally leave the competency of their physicians and surgeons to the judgment of those competent to determine such matters, since they are not qualified to make the determination themselves. They performed their full duty toward the patrons of the hospital in appointing a competent board to examine applicants, and in acting upon its report by the appointment of this surgeon. The testimony on the part of the superintendent of the hospital was that, as a surgeon, he was considered one of the most competent young men they ever had in the hospital. As before stated, no charge of incompetency had ever been made against him. The trustees were therefore, the court holds, not negligent in retaining him. Even if this were not a charitable institution, the full duty of the trustees in employing and retaining him was performed. Moreover, there was no evidence of negligence on the part of the surgeon. The family physician of the patient testified that he would have tried to have saved more of the arm which was amputated, but, on cross-examination, admitted that he did not consider it negligent to do what was done, different medical and surgical men of equal experience having different views in such cases; and the sole testimony as to the propriety of attempting to save more of the arm in the amputation rested entirely upon the family physician's testimony. But the court does not think that this testimony was of any probative force to show negligence on the part of the attending surgeons, or to justify the submission of the question of malpractice to the jury.

2. **Phimosi.**—This article points out the probable causes of the condition, which Griffith thinks is rarely congenital, but usually due to irritation occurring after birth. The pathologic consequences are numerous. A large proportion of the cases recover spontaneously. He insists on the importance of early examination of the genitals in both sexes as the analogous condition exists in each, and as far as the nervous symptoms are concerned the results are the same in both. If dilatation is attempted, an important point is not to do it too frequently, as it may produce fissures and scars which defeat the object. The latter part of the article is devoted to the subject of circumcision, its methods, etc. He does not hold it as positively proven that the circumcised are more exempt from venereal diseases than the uncircumcised.

3. **Myopia.**—A recapitulation of Duane's article is given as follows: 1. Making the patient employ the full correction of his myopia all the time and both for distance and near. This is of prime importance in all varieties of myopia, low, medium and high, and, if applied early, may check the progress of the myopia altogether. 2. Proper attention to illumination, the size and legibility of the print, the quality of paper used in the books read, the relative height and disposition of the seat and desk, and the many other factors that have been brought out by the zealous investigators into the subject of school hygiene. These are important but subsidiary matters. 3. In low and medium myopia, moderate restriction of near work, or rather its better distribution, so that it is done mainly by daylight and not for too long at any one time. Furthermore, momentary rest of the eyes at frequent intervals during the work. These rules to be the more strictly enforced, the higher the myopia and the younger the patient. 4. In high myopia with evidences of progress, much more stringent restriction of near work. Open-air work to be encouraged and the adoption of confining and eye-taxing occupations forbidden. 5. In medium and especially in high myopia, plenty of sleep and out-of-door exercise. 6. Re-examination of the patient at frequent intervals (which in the case of high myopia should be very frequent), to determine how much the myopia has increased. If it has increased, the glasses should be increased also up to the full strength, and the hygienic regulations above detailed modified accordingly.

6.—This article is in substance the same as the communication in THE JOURNAL of June 7, p. 1525.

7. **"Green Groin."**—This is the name that Price gives to the condition that perhaps can be more readily understood under the name of gangrene of the appendix. His article is a strong statement of the surgical side of the case in the treatment of appendicitis. He points out that many cases of appendicitis

simulate typhoid, and this is a point that should be borne in mind, especially where the diagnosis is obscure. He urges surgical interference, early, late and at all times and considers the indications exactly the same whether the peritonitis be circumscribed or general. He criticises the imperfect toilet and inefficient operations.

8.—See editorial in this issue, p. 1626.

9. **Avulsion of the Scalp.**—Bivings gives a review of the old literature on the treatment of scalped head, showing the crude methods in early times in this country by boring holes through the skull and obtaining cicatricial tissues by the growths which come through them. He reports and illustrates a case of avulsion, in which skin grafting was performed and emphasizes the following points: 1. The benefit of shaving, thoroughly scrubbing and rendering scalp wounds as aseptic as possible at the first dressing, thereby securing freedom from virulent bacteria and preventing meningitis, cerebritis, etc., by extension per diploic veins. 2. The superiority of the Thiersch method of skin-grafting over all other methods tried. 3. The fact that skin-grafts taken from the body of the patient grow far better than grafts from the skin of other people. 4. The error of always attributing in surgical work a rise in temperature to wound infection, and to suggest a thorough physical examination for some existing complication.

10.—See abstract in THE JOURNAL, xxxvii, p. 927.

13. **Venereal Diseases.**—Bailey reviews what has been done to check the progress of venereal diseases, holding that regulation is a failure and that education of the public is required so that measures preventing the marriage of those who are infected may become the rule. He thinks no one should allow a daughter to marry without a clear medical record on the part of the intended husband.

17. **Early Surgical Intervention.**—Park's article is a plea for early operative surgery in cases which may require it more obviously later, cancer for instance. He claims that well-founded suspicion justifies operation for its determination and relief. The danger of procrastination is, he holds, far greater than that of early operation. Other disorders mentioned are epilepsy, in which he thinks much good can be done by surgery on the brain if taken sufficiently early. Most operations done for this cause are done too late to be of use. Meningitis is another disease which may be profitably operated on in many cases, and lumbar puncture is a measure which has not come into sufficient favor with physicians. He advocates the early use of antitoxin in tetanus by the intracerebral method and speaks also of the surgical treatment of nervous gland disease, tuberculosis of the cervical glands, pulmonary disease and gangrene, empyema, pericardial effusion, liver abscess, tumors, pancreatic disease, splenic disorders, kidney affections, gastric and intestinal cancer and other growths, tuberculous peritonitis, etc.

18. **Review of the Progress of Therapeutics.**—This article is too elaborate to be abstracted.

20. **Digestive Ferments.**—Hemmeter remarks on the irrational use of various digestive ferments which are usually prescribed in the shotgun way against the target labeled dyspepsia. The substances may be considered as by-products of the large packing houses, are widely advertised and are prescribed often for this reason where they can do no good, but may often do harm. We should not attempt to coddle the stomach and prevent it doing its own work by pouring pepsin or hydrochloric acid into it. It is best not to do the work for it. As regards pepsin, of which many preparations are now on the market, some of them having very little value, he holds it is prescribed only too often, and he has ceased to use it himself. Pancreatin is another sometimes active preparation, which spoils, however, and loses its digestive power with age. It should not be used with pepsin, as it is destroyed in the gastric juice. There is but one distinct indication for its use, and that is permanent deficiency or complete absence of HCl enzyme formation of the stomach. He speaks in conclusion of pancreon, the last addition to the ferments, which has some advantages in cases of gastric achylia and chronic atrophic gastritis and intestinal atrophy.

The chief guiding line for all rational employment of all agents designed to aid the digestive processes should be careful examination of the stools. If possible, the disorder should be treated without any ferment whatsoever, and this is practicable in most cases. It is only in the rare combinations of intestinal disease with gastric atrophy that the use of such a ferment as pancreon seems rational on theoretical grounds.

**21. Drug Habits.**—Hare refers to a former communication by Dr. Lott of Cameron, Texas, which was published in the *Therapeutic Gazette* of February, 1902, and abstracted in *THE JOURNAL* of March 22, [144, p. 793, in regard to the use of hyoscin in the treatment of the alcohol and drug habits. He has himself since tried the plan in six cases which gave extraordinary results from the following points of view: 1. The patients can take massive doses for days at a time, as much as one-fourth of a grain each day with no bad effects on any of the vital functions. 2. They suffered very little if at all from the immediate withdrawal of morphin. 3. The desire for the drug was largely if not entirely dissipated after a few doses. He details several of his cases and remarks on the extraordinary fact that such large doses of hyoscin can be taken in these conditions, and says that Dr. Lott deserves a great amount of credit for his courage in carrying out this treatment. It has been so successful in Hare's hands that he will adopt it in the future. While the few cases in his experience do not justify advising the treatment as universally applicable, the results obtained seem to justify the communication.

**22. Faith Cures.**—Bailey attributes the prevalence of faith cures to the existence of a class of defective persons in whom the subconscious self predominates and that it indicates a tendency which Lceb calls tropism, an automatism unguided by intellectual control. Practically these adherents of faith cures are of a lower type, a defective one. He thinks there is no use antagonizing them; these delusions should be given the widest possible latitude to kill themselves. Crazes of all sorts are self limited and self-destructive.

**23. Bilateral Cystic Kidney.**—Osler reports a case in which the patient's mother died of the same disease and refers to other instances in the literature noted by Morris, Bar and Borelius.

**24. Pleurisy.**—Cabot has studied the outcome of cases of pleurisy where there was reason to believe serous effusion existed, but where there was no evidence of tuberculosis either in the lung or elsewhere. The questions sought to be solved were what chances these patients would have to become tuberculous later, and if so, what would be the average progress of the case? Also the problem of permanent and complete recovery and the length of time after which the patient can consider himself free from the danger of contracting tuberculosis. He followed up 152 cases of pleural effusion by letter and personal observation out of a total number sought for of about 300. From his statistics he is led to the following conclusions: 1. Eighty per cent. of the patients, having uncomplicated serous pleurisy, who have been followed for five years or more are in good health. (More than half of these have been followed for ten years or more.) 2. Ninety per cent. are apparently in full health at the end of from two to five years—that is, the pleurisy has no immediate connection with any other affection. 3. Fifteen per cent. of the patients sooner or later developed demonstrable tuberculosis of lung or bone. But in only 3 per cent. has this tuberculosis manifested itself within two years of the date of pleural effusion. 4. The type of tuberculosis which occurred in these cases was, as a rule, mild and of slow course. Death did not occur until five years or more after the pleurisy in one-half of the 23 patients who developed obvious tuberculosis. Six of the 23 are still alive, in despite of the tuberculosis, after periods of 10, 9, 6, 4, 2 and 1 years. 5. Nevertheless, a very rapid form of tuberculosis may develop many years after the pleurisy—9 years and 16 years respectively in two cases of this series—so that the patient is never safe from the possibility of death from tuberculosis merely because his pleurisy lies 10 or 15 years behind him. 6. A study of the clinical records of the whole group of patients under consideration shows that among those who have remained in perfect

health for five years or more only 25 per cent. had any family history or past history of tuberculosis, while of those who have become tuberculous two-thirds had tuberculosis in their immediate family, or in their own past history. A careful history, therefore, is of great importance in the prognosis of pleural effusion. On the other hand, the physical signs during the course and convalescence of the pleurisy were not markedly different in the group of cases in which tuberculosis later developed from the signs in those who have remained well. 7. Recurrence of the pleurisy itself in patients who have recovered from the original attack occurred in only five cases, or 3 per cent. of this series. Reaccumulation of the fluid immediately after tapping is rare, occurring in only two cases, or 1.3 per cent. 8. Among the 14 patients who, after recovering from the pleurisy, died of some other disease, not one developed any disease which could reasonably be considered a result of the pleurisy—the causes of death were alcoholism, hepatic cancer, dysentery, pulmonary embolism, mitral stenosis, aortic regurgitation, chronic nephritis (3), cerebral hemorrhage, measles, pneumonia (3). 9. Finally, he would call attention to the fact that he has made no attempt to discover what percentage of this whole group of cases is due to tuberculosis. So far as his statistics go the cases may be all of tuberculous origin. What his figures do tend to prove is, that whether pleurisy means tuberculosis or not, the outlook is bright provided no family history of tuberculosis clouds it. If pleurisy means tuberculosis, it is a very mild form of tuberculosis, and one from which recovery is usually complete under proper treatment. Even if the lungs are attacked later the type of the disease is unusually mild. He remarks in conclusion that the data in regard to fatal cases are much more easily gathered than those of persons alive and well, who are readily lost from sight.

25.—See abstract in *THE JOURNAL*, xxxvii, p. 850.

**28. Mercurial Dermatitis.**—The case reported by Shelmire was one of very serious erythematous eruption produced by the ingestion of mercury, a cause which has been questioned by some authorities. He reviews the opinions to some extent, which seem to support the possibility of such occurrence and consequently reports his case.

**32. Inhibition.**—Meltzer's article discusses the phenomena of inhibition, which he believes has the same extent as irritability and is, like it, a vital process. He thus formulates the general biologic law of irritability. All the living tissues are irritable, that is, they respond to stimulation with a vital reaction. This reaction can be either the manifestations of their specific activity, and we shall henceforth term it excitation, or it can be an inhibition of an existing activity. Rest, he says, is as much a vital manifestation as activity. His discussion of the subject is elaborate, showing the rôle of inhibition and applying his theories to pathologic states as well as normal. To be appreciated, however, the article must be read.

**33. Appendicitis.**—Wyeth employs two incisions in appendicitis, the "gridiron" or McBurney incision, and the "clean-cut" through all the tissues from the skin into the peritoneal cavity. The former should be selected when the conditions permit. As he practices it, it is done as follows: A cut through the skin, at least three and oftentimes four inches in length, is made, and this, while parallel with the linea semilunaris, is made nearer the iliac spine, so that immediately beneath the cut through the skin the transverse fibers of the internal oblique and the transversalis muscles may be encountered. If the incision is made over the linea semilunaris, the separation of the muscular bundles will not give sufficient room, necessitating the division of this fascia, which, in his opinion, should be avoided when possible. When the external oblique aponeurosis is reached it is split in the direction of its fibers, and the edges held apart with retractors. With two dissecting forceps the muscular bundles of the internal oblique and transversalis are next separated down to the peritoneum, and these are strongly retracted with dull instruments. The peritoneum is now in sight and may be incised in any direction, preferably in the direction of the incision through the skin. This peritoneal incision should be about one inch in length. An opening of this

size permits the introduction of one or two fingers, enables the operator to feel and detach, by breaking up any adhesions, and to bring the appendix and a very small portion of the cecum through the opening into the wound where it can be easily held until the mesoappendix is tied off and the organ itself tied with a silk ligature about one-quarter of an inch from the cecum and then removed. He prefers the silk ligature to any other method of treating the stump. He has used it in all of his operations except one, and has no reason to regret using it in any instance. The funnel-shaped stump left beyond the ligature is thoroughly swabbed with pure carbolic acid. He uses a running catgut suture for the peritoneal wound, and loose kangaroo tendon suture for reapproximating the separated muscular bundles of the transversalis and internal oblique; interrupted kangaroo tendon for the external oblique fascia, and silkworm gut sutures for the skin, which completes the technic. He says this incision should be used in all "clean" cases, in those operated upon in the period of quiescence, and in others when the inflammatory and septic processes are limited either within the lumen of the appendix or about its walls, and there is no more than a limited local peritonitis. When there is well-marked abscess and the process has gone far enough to wall-off from the peritoneal cavity the diseased organ and pus which is around it, he does not approve of enucleation of the abscess wall formed by adhesions in such a narrow incision, and it is safer to enlarge the opening and have a free field of operation than run any risk of spreading sepsis. Here an incision shorter than three inches is usually advisable, and it is best simply to incise, puncture and drain the abscess if it is well marked, the operation resolving itself then to simply opening the abscess and supporting the muscle fibers after the McBurney method, and puncture of the peritoneum adherent to the abscess wall. But when a condition of sepsis prevails, such as requires careful operation to prevent general peritonitis, he resorts to the clean through-and-through incision, including the peritoneum. When this is to be made it should be over and parallel with the linea semilunaris, in order to avoid cutting the transversalis and internal oblique muscles through their fibers which retract and leave a weak line of union. The peritoneum is to be sutured with catgut, the aponeurosis of the semilunaris with kangaroo tendon, and the skin incision with silkworm gut or with a single row of sutures of the last-named material, including the skin with the aponeurosis. He calls attention to the error of tying kangaroo sutures so tightly as to destroy the vitality of the muscles as he has sometimes observed. When the gridiron incision is used it may not be necessary to keep the patient in bed as long as when a through-and-through incision is employed, but he thinks it well to keep the patient in a recumbent position for at least three or four weeks after the operation and at least six weeks with a through-and-through incision, not even sitting up. Since he has followed this rule he has not had a single case of ventral hernia even following in some instances extensive incisions.

**34. Cesarean Section.**—The title of this article explains it, but the interesting features of the case are summed up by Brothers as follows: 1. The fact that the woman had spontaneously given birth to three living children, although the tumor must have been of some years' growth. 2. The recovery of the mother after cord and uterine contents had undergone decomposition with resulting maternal sepsis. 3. The mental derangement which showed itself about the ninth day and was evidently the direct result of the operation. 4. The escape of the intestines for several hours after the spontaneous reopening of the wound, without fatally influencing the progress of the case. 5. The desirability in sepsis preceding delivery (in cases requiring Cesarean section) of immediately combining abdominal hysterectomy with Cesarean section. The risk of additional shock is fully met by the advantage of removing from the woman's system the infected uterus. I have, in similar cases, known women to die of subsequent septicemia after the uterus had been emptied through the natural passages. Hence, sepsis preceding delivery offers to me a strong indication for the removal of the uterus either at the time of delivery or shortly afterwards if the septicemia does not rapidly abate.

**36. Rectovaginal Fistulae.**—The method employed by Vineberg in his first case is given by him as follows: 1. Operation on the patient consisting of the usual method of splitting the sphincter, denuding the edges of the fistula and suturing it separately was a failure. It then occurred to him to excise the rectal mucosa to a point beyond the fistula, draw down the mucosa and suture it to the skin as in a Whitehead operation for hemorrhoids. This he accordingly did, and excised about an inch and a half of the rectal mucosa. He then dissected the rectal mucous membrane to fully an inch beyond the cut border, so as to be able to bring it down to the cutaneous border of the anus without undue traction. The mucosa was then sutured to the skin by a number of catgut sutures and with a couple of deep silkworm-gut sutures. Patient made good recovery, having primary union throughout, and has been perfectly free from any rectal symptoms since. He says he thinks an important feature in the success of the method lies in dissection of the rectal mucous membrane beyond the excised portion so as to be able to attach it to the cutaneous margin of the anus without any tension. Failure to do this is the frequent cause of bad results in the Whitehead operation. He intended to publish this operation after first performing it as it was then original with him, but procrastinated, and since then both Dudley and Segond have published cases operating in the same way. To the latter falls the credit of priority, though both Dudley and himself had devised the operation independently.

**41. Reduction Cures.**—The subject of reduction cures for obesity is noticed by von Noorden, who criticises the routine method of treatment of some physicians. Before entering into the treatment of an obese patient, he should first of all decide the question as to whether an actual reduction cure is indicated or whether the treatment should be restricted to the prevention of further fat deposits and to the removal of dangerous and disturbing complications. The physician and patient may differ on the question; reduction cures have become so popular that many patients demand them. They do not ask the doctor whether he considers the cure necessary but just ask for his prescription and directions. It often happens that the patient may expect local treatment when the physician thinks general is demanded, or vice versa. He argues against considering reduction cures as weakening cures, which they should not be if carried on under proper indications and with proper choice of procedure and rapidity.

**66. Methyl Alcohol Amblyopia.**—Burnett reports a case of methyl alcohol amblyopia due to drinking Jamaica ginger, in which he observed central color scotoma, involving all colors except blue in the least affected eye, and the general perception of other colors, except blue, was either absent or not of a normal character. Corresponding with this scotoma for colors there was also a reduction of form sense as shown by the diminished visual acuteness. All these conditions point rather to a neuritis affecting principally the papillo-macular bundles, but at the same time not sparing the others, as shown by the affected color sense all over the whole field.

**68. Ophthalmic Oscillator.**—Muncaster calls attention to an instrument devised by Dr. Henry F. Garey under this name as affording a method of treatment of chronic intraocular diseases, such as nerve atrophy, choroidal troubles, etc. The method consists of causing an oscillation of the eye forward and backward, and its application is adapted to each individual case. This oscillation is produced in such a way that the forward movement of the eye is made by intermitting vacuums produced in the cup, which is placed over the eye, and the backward movement by the eye being pulled back by the elasticity of the tissues to which it is attached. The oscillation of the eye produced in this manner causes an alternate stretching and relaxation of the nerves attached to its posterior portion, powerfully stimulating increased nutrition and light perception. He reports cases in which this has been used to advantage.

**74. Ovarian Tension Pain.**—Howitt considers that many cases of severe ovarian pain are due to overgrowth of the cortical region or the capsule of the ovary and that relief can

be obtained by conservative operation. He thinks that in order to make such an operation justifiable the pain and general disorder should be disabling. The surgeon, as a rule, should be able to satisfy himself by examination that the ovaries are somewhat enlarged, more or less rounded in shape, tense and abnormally sensitive. There should be a history of aggravation of the symptoms before or during menstruation or from anything that excited ovulation. The operation which he has performed consists in exposing the ovary guarded by a sterile sponge or gauze and making a number of cross cuts through the dense capsule in such a manner as to divide it into small islands not more than a square line in depth. The tension is manifested by the way in which the first incision gapes. All the cysts are opened, those larger than a grape are enucleated, while the cavities of the smaller are merely touched with pure carbolic acid. In his practice when the capsule is thick he shaves off one or two rows from end to end of the organ and then from side to side, thus exposing a cross of denuded tissue, but not removing any portion of the normal ovarian tissue. At the completion of the procedure the organ is not only reduced in size and weight but also regains its size and shape. Hemorrhage has never been troublesome, nor have adhesions given rise to complications. The relief of the pain and the worrying reflex has been very satisfactory. He briefly reports two cases out of the 14 in all for which he has advantageously operated.

**83. Deformities of the Bones of the Face and Nose.**—Talbot discusses the subject elaborately and holds that traumatism can not be taken as the common or exclusive cause of septal deformity, and criticises other theories. He thinks the findings in normal vaults and jaws conclusively disprove the theory that high vaults and contracted arches are the cause of septal deviation.

**88. Ichthargan.**—This material, which is a compound of silver and ichthyol and chemically known as silver-thio-hydrocarbo-sulphonate, is readily soluble in water, glycerin and dilute alcohol, but insoluble in absolute alcohol, ether and chloroform. It should be kept in colored bottles. It is precipitated by sodium chlorid and albumin, but the latter precipitate is redissolved by an excess. It contains 30 per cent. of silver and 15 per cent. of sulphur, both in organic combination with the bases from the ichthyol sulphonic acid. It is, therefore, the strongest of all the silver compounds. Douglas quotes experiments by Aufrecht as to its penetrating and bactericidal power and its comparatively non-toxic action. Aufrecht took 3/10 of a grain of ichthargan in three successive doses, and on the fourth day one-half a grain without unpleasant effects. For nose and throat work it must be used in preparations from 1/50 to 1/10, 1/20 being suitable for general use. He finds it of value as an anesthetic, antiseptic, antiphlogistic, stimulant, alterant, and as a modifier of nasal secretion. The anesthetic effect is not very marked. The antiseptic effects are plainly shown in its deodorizing properties, and as an antiphlogistic it has an important action on the respiratory mucous membrane, first producing anemia, followed by no reaction unless very strong solutions are used, and tolerance may be established by continuous use. As a stimulant it acts as an alterant, producing more healthy circulation, diminished congestion and lessening exudation and probably acts directly on the cell protoplasm itself. In modifying secretion it seems to act by lessening leucocytosis. He thinks good results can be obtained in atrophic rhinitis, acute catarrhal rhinitis, tonsillitis and inflammation of the lingual tonsil. It can be safely recommended in certain laryngeal affections, such as acute catarrhal laryngitis of adults, in a spray, and in laryngitis sicca and in chronic atrophic trachitis where there is abundance of dry saliva and scales. He reports two cases of atrophic rhinitis where it was used with advantage.

**98. Blood Examination.**—This article was abstracted in *THE JOURNAL*, Vol. xxxvii, p. 1563, and noticed again in the present volume, p. 421, ¶45.

**99.**—This article has appeared elsewhere. See *THE JOURNAL* of March 29, ¶100, p. 846.

**111. Smallpox.**—Ridings is an advocate of bichlorid of mercury in the treatment of smallpox, applying it in solution of 1 to 250 to 1 to 1000 as a spray to the nose, mouth, eyes and ears, with a saturated solution of boric acid over the eyes. The bichlorid solution is sponged thoroughly also over the whole surface. He agrees with Bibb that when thus applied it is the rational treatment and will prevent itching, foul odors and pitting, and will destroy the virus in the vesicles and pustules, thus rendering the scabs harmless, and reducing the danger of infection to a minimum.

1. **Prostatic Adenomata.**—Thomson refers to Freyer's work on the subject and especially mentions the difference of opinion in regard to the capsules of the prostate, pointing out that there are three things which are mentioned under this name: 1. The proper capsule indicated by Freyer, which is a special envelope, belonging to the prostate itself, and, although thin, is firm in texture, and defines clearly the form and limits of the prostate. 2. A layer of thinned prostate which remains in certain cases when a large adenoma is enucleated. 3. This is formed by the normal reflection of recto-vesical fascia. The question as to whether the whole prostate can be removed is also mentioned and he finds the testimony a little perplexing. However, it is not of much particular interest beyond emphasizing the importance of accuracy in the use of the term in the description of the operative procedures. It is not of much matter to the patient whether a complete prostatectomy or removal of the adenomata is performed if the mechanical obstruction is relieved.

3. **Myasthenia.**—Gowers reports another case which is of interest as presenting—like those previously noticed—an ophthalmoplegia, but where the peculiar "nasal smile" was not present. There was also a marked difference between the two sides, especially in the face and hands, and there was some local diminution of electric excitability and slight atrophy of the muscles. The development of epilepsy in this case is also a fact of unusual interest of which he has seen no mention in other recorded cases.

4. **X-Rays.**—Morris and Dore point out the advantages and disadvantages each of the x-ray and the Finsen light treatment.

The latter is tedious and costly, but they do not consider the x-ray an adequate substitute. In the majority of cases the Finsen method is more reliable in lupus or rodent ulcer and apparently gives more permanent results. The effects are more easily controlled and the scars better. They think the therapeutic effect in both is much greater when reaction occurs.

5. **X-Rays.**—Lancashire reviews the effects of the x-rays and finds them of special value in hypertrichosis, coccogenic syphilis, lupus and rodent ulcer.

8. **Skoliosometer.**—Young describes an instrument formed to some extent on the von Mikulicz plan but without his special recording instrument, consisting of two limbs graduated on the metrical scale, and fixed by an accurately adjusted central frame exactly at right angles to each other. Both limbs slide freely in the central frame, and each is graduated in both directions from zero at its midpoint. He thinks this apparatus a great advantage in making accurate measurements in case of lateral curvature of the spine, also in chest measurements. He believes that such an instrument as this would be of service, also in craniometric work.

9. **The Personal Factor in Microbic Disease.**—This article by MacKenzie is largely on the same line of thought as that of Howship-Dickinson noticed in a previous issue. MacKenzie speaks particularly of the importance of the soil in cases of tuberculosis as being a matter of which we must take most account. He holds that the microbe is comparatively unimportant of itself, but that it is too great a stretch of truth to say that tuberculosis is one of the more curable diseases. We may arrest tuberculosis under our treatment, but we can not make sure that it will remain inactive. One point, however, to which he calls special attention is the fact that the decrease in the mortality from consumption which has been going on for the last fifty years, not only in Great Britain, but also in other countries where statistical evidence is available, preceded the exact knowledge which we now have of the pathology of tuberculosis and the discovery of the bacilli. This diminution was going on under unfavorable conditions before any effective measures were begun to destroy or disinfect the sputa or separate the sick from the healthy. It has also gone on in spite of the great migration from country to town. There is no doubt that it has been due to measures which have increased the resistance by improved sanitation, better drainage, sewage and better housing, clothing and feeding of the population. He also refers to other diseases, such as rheumatic fever and appendicitis, calling attention to the fact that whether we establish the bacterial nature of rheumatism or not the personal factor will be as important in the future as in the past, and our clinical acquisitions will not be lost. Similarly with appendicitis, which seems on the other hand to be more common, thus reversing the conditions in tuberculosis, there seems to be, as Treves has remarked, not infrequently a family or hereditary tendency. We must bear in mind in all these groups of diseases, he thinks, that the soil as well as the seed is of utmost importance.

11. **Hernia.**—Russell states his belief in regard to hernia, based on his operative experience, which he had strongly enunciated in a previous article as follows: 1. Oblique inguinal hernia is invariably caused by the presence of a congenital sac, which in the vast majority of cases is provided by patency of the whole or a portion of the processus vaginalis. 2. There is no evidence in favor of the view that congenital weakness of the abdominal wall in the inguinal region is a factor in the causation of inguinal hernia. 3. While actual weakness of the abdominal wall in the inguinal region is frequently met and is an occasional cause of recurrence after operation, such weakness is not congenital, but is an acquired weakness due to the existence of a hernia and the use of a truss during a lengthened period. 4. Complete removal of the sac, when performed before the abdominal wall has sustained such damage, will not be followed by recurrence. 5. The causes of recurrence after operation are three in number—viz.: 1, the above-mentioned

acquired weakness; 2, incomplete removal of the sac; 3, traumatism, the result of misguided methods of operating. The arguments on which these are based were published before. He has since seen other cases which nearly double the number, and which have only strengthened his views. Instead of weakness being congenital and hernia the consequence, it is the hernial sac that is congenital and the weakness that is ultimately acquired. He goes into the anatomy and embryology to explain this fact, the details of which can not be reproduced, and applies it not only to inguinal, but to femoral hernia, which, if anything, is the most likely to be the acquired form, according to the usual opinion.

**25. Ulcus Rodens.**—Dubreuilh distinguishes the nodular, the atrophic and the boring type of *ulcus rodens*. It invariably commences with a nodule. It may ulcerate early or not until after a few months, or may persist indefinitely without ulceration. The nodular variety is therefore merely an *ulcus rodens* arrested in its early stage.

**27. Years' Experience with Phototherapy.**—Gastou has employed the Lortet-Genoud apparatus for phototherapy in 121 cases of various forms of cutaneous tuberculosis and 25 of other cutaneous affections. This apparatus was described and illustrated in *THE JOURNAL* of July 20, 1901, p. 229. He reports eminently favorable results in a third of the cases of ordinary and erythematous lupus, but in cutaneous tuberculids and in boring lupus only one-sixth of the cases manifested any improvement. Dispensary patients usually wait until lupus is practically incurable before they apply for treatment, and as 40 to 200 sittings are necessary to cure or even improve a case of lupus, it is easy to understand why better results were not obtained with the ordinary class of out-patients. They abandon treatment before positive results have been secured. Only 46 of the 121 patients with cutaneous tuberculosis completed the course. Of these, 11 were cured, 12 partly cured and 7 not benefited, out of 30 with tuberculous lupus. Three were completely and 7 partly cured in 10 cases of erythematous lupus, and 1 completely and 5 partially cured in 6 with cutaneous tuberculids. When the patient applied in the early stages of lupus it was possible to cure him in the course of two months and in the best possible conditions, without pain or the knife.

**28. Indications and Contra-Indications for Phototherapy of Lupus.**—Leredde observes that phototherapy is the only means of treating lupus which realizes the two indispensable conditions of action below the surface, sparing sound tissue and homogeneous action. It does not cure every case, but its failures are rare and are usually due to the consequences of previous methods of treatment. Physicians may try other and simpler measures first, but if the patients are not cured after a few months, phototherapy should be applied. Ablation should be the rule when complete reunion by primary intention can be counted on. Of the 43 cases of severe lupus he has been treating, he reports 8 completely and 7 almost completely cured by the phototherapy. All were cases of long standing and had been treated for years by various means. Fourteen other patients have been cured of one or more patches, and the cure of the rest of the lesions is only a question of a little more time. In two cases marked by exuberant vegetations, the application of potassium permanganate as recommended by Butte aided in reducing the excrescence and cleared the field for the phototherapy. The results of the phototherapy in erythematous lupus were 3 failures, 3 improved and 11 completely cured out of a total of 23 patients treated, while 6 more exhibited a "segmentary cure," that is, one patch was cured. To fully appreciate these results he reviews the previous treatments inflicted upon this group of patients. They include 802 sittings of Galvanocauterization, 382 of scarification and 462 of the high frequency current. None of them had had even a single patch cured by any of these measures. The cases which promised to be the most rebellious were sometimes most rapidly cured. He thinks that phototherapy should be pushed until there is formation of cicatrices. It is liable to fail in the vegetating, elephantiasis type of lupus or where there is deep sclerosis, unless the field can be cleared for the action of the

light. Phototherapy is contra-indicated in case of lupus of the trunk or limbs which may heal more rapidly under other measures owing to the existence of a plane of hypodermic cleavage which generally prevents the progression of the lesion into the depths. Every case of erythematous lupus should receive energetic treatment from the start. Finsen has demonstrated that the longer it lasts the deeper and more rebellious it becomes. If it still proves obstinate after a course of phototherapy, radiotherapy should be given a trial, and in certain limited regions ablation might be indicated. Scarifications or cauterizations should be carefully avoided during a course of phototherapy as, to mention only one reason, they prevent the penetration of the light.

**29. Iron Lamp for Phototherapy.**—Broca's apparatus is a modification of Bang's which has been mentioned in *THE JOURNAL*. The lamp is constructed to produce as many chemical rays and as few light rays as possible, by using iron for the arc. The contrivance for compressing the part is ingenious. A metal cap fits over the head. It contains an air cushion at the back and has buttons along the edge in front. The compressor is a piece of quartz set in a framework that has projecting strips of metal tape which button on the buttons on the headpiece. When all is in position the air cushion is inflated and the compressor screwed to the proper angle. The compression is perfect by this means.

**33. Ignipuncture of Cancer Followed by Application of Solutions of Copper.**—Moreau reported in 1900 that he had been able to cure 42 cases of cancer of the skin or mucosa with no recurrence for more than three years and he now reports sixty-six additional cases. He uses the finest point of the Paquin or Gaiwanocautery for his interstitial ignipunctures, with care to have them especially deep around the edges of the neoplasm. Two days later he rinses and dresses the wound with a 1 per cent. solution of ammoniacal copper sulphate or sprays the wound for a long time twice each day with the natural copper waters of the Trebas springs. The natural copper water seems to be especially beneficial, exerting both a healing and cicatrizing action, while the application is not painful as in case of aristol and potassium chlorate.

**35. Topography of Myelopathic Muscular Atrophy.**—The *Iconographie*, as its name implies, makes a specialty of illustrations of patients. Cestan's and the other articles are accompanied by a wealth of photographs.

**40. Suturing by Means of Clamps.**—*THE JOURNAL* has referred several times to the method of suturing devised by Michel, which consists in placing a row of double-pointed clamps or agrafes along the wound. This article gives illustrations of the "revolver" used to drop the clamps in place, the pliers to squeeze the points closer together, and the forceps to remove them later. It states that a number of surgeons use this method of suturing cutaneous wounds almost exclusively. The skin is not pierced by the points and the clamps leave no trace if properly placed.

**41. Arthritism and Its Treatment by Oxidizing Measures.**—Fiquet explains the arthritic tendency as the result of insufficiency of the phenomena of oxidation which normally occur in the tissues under the influence of the soluble elements which we call oxydases. On account of this lack of sufficient oxidation, the system becomes loaded with the refuse of unoxidated matters which induce gout, lithiasis, obesity, etc. The treatment should aim to promote the processes of oxidation. If an immediate effect is necessary alkaline waters will answer the purpose, but for a more pronounced general effect iron waters are preferable or, better still, a combination of Vichy and some iron water or their equivalents. The best clinical results have been obtained, he states, with iron crenate as a drug or in the waters of Forges-les-Eaux. The properties of crenic acid enhance the efficacy of the iron.

**42. Radical Cure of Hypertrophied Prostate.**—Albarran's long experience has demonstrated to his satisfaction that the contractility of the bladder is not entirely lost in "prostatic patients," and that after removal of the prostate the bladder

regains its contracting power. This has occurred in all of his patients operated on by perineal prostatectomy. He has performed the operation 35 times and has lost but one patient. The latter succumbed to progressive cachexia from bilateral pyelonephritis. The others rapidly recovered, proving the benignity of the intervention. One of the cured patients was 73 years old and had been using the catheter for eleven years. The prostate weighed 230 gm. Albarran's operation is a perineal subcapsular prostatectomy by systematic morcellment. Of the 31 patients operated on by this method and followed to date, 28 are completely cured and 2 are practically cured while one patient requires another operation on account of a persisting fistula. Figures, he adds, can give no idea of the benefit derived. Invalids have been restored to active life and the transformation is complete. He does not operate if there is fever but applies palliative measures until a favorable moment arrives. Infection of the bladder and even general infection of vesical origin may be an indication for this perineal prostatectomy. Eleven of the above patients had stones in the bladder, and the removal of the prostate has prevented further trouble from the stones which previously used to accumulate behind the enlarged gland.

**48. Rhythmic Jerking of the Head in Affections of the Aorta.**—Valentino has observed or collected fourteen cases of insufficiency of the aortic valve or of aneurism of the arch of the aorta, which were distinguished by a rhythmic jerking of the head. This is not a constant sign, but it is so peculiar and striking when it does exist, that it attracts the physician's attention at once, as possibly the first indication of a serious lesion in the cardiac region. All nervous affections must be excluded before the diagnosis is certain.

**51. Medicinal Treatment of Tuberculosis.**—A résumé of this article will appear in the "Therapeutics" column of THE JOURNAL.

**52. Treatment of Sciatica.**—Skillful application of the Scottish douche, hot baths and massage has cured all but one in twenty-four cases of sciatica which Brieger has had occasion to treat. The bath at 100.5 F. should be in a large tub and many movements which are otherwise painful can be performed in the water as the heat soothes the aching parts and relaxes the muscles. Massage immediately after the bath is borne much better, and the final cure is hastened. One of the three patients treated in his institution was cured in forty-six days after a year of sciatica. The second was cured in eleven weeks after eighteen months of sciatica, and the third in thirteen days after two years of the affection. This latter patient was a corpulent woman of 54. She received six Scottish douches and two hot baths of ten minutes each, at 98.5 F. and then two at 104 F. for fifteen minutes. When she left she was able to walk erect without support, and there was scarcely a trace of spontaneous pain, although stretching the knee with the thigh flexed was still slightly painful. The ambulant patients received a Scottish douche and massage two to four times a week. All of the cases were extremely severe and had been previously treated in vain with the entire array of the usual measures. The one case rebellious to these hydrotherapeutic measures and massage confirmed Winternitz's statement that when they fail some complication of the sciatica can be positively assumed.

**53. The Antroscope.**—Reichert treats suppuration in the maxillary sinus by way of the alveole after extracting a tooth. He inserts a hard rubber plug about 7.5 to 8 mm. in diameter and 28 long with a projecting base. This keeps the hole open and allows visual inspection of the cavity by the little instrument he has devised for the purpose, on the principle of the cystoscope. It is about 13 cm. in length and revealed the presence of a tumor or cyst in the three cases in which he has applied it to date.

**54. The Problem of Hemiplegia.**—Rothmann argues to prove that the restitution of active movements in persons affected with hemiplegia is not due to the recuperation of the tracts which have been injured. Restitution of active movements is due to the substitution of other tracts for the injured

ones. It is consequently a therapeutic indication of the greatest importance to exercise the paralyzed limbs and practice the muscles of the new routes as soon as possible after the onset of the paralysis. These therapeutic exercises may be effectively supplemented by transplantation of tendons into the paralyzed muscles.

**55. Abortive Treatment of Gonorrhea.**—This article will be reviewed in the "Therapeutics" department of THE JOURNAL.

**58. Diabetes Insipidus and Paralysis of the Bladder.**—Posner describes the case of a man of 48 with polyuria and retention of three-fourths of the urine, which averaged four to six liters a day. Except for a slight cystitis which developed after the catheter was used, he was apparently normal in other respects. The specific gravity of the urine was always below 1005. Posner believes that the trouble was a primary degeneration of the bladder, commencing at the age of 42. It is possible, however, that the paralysis of the bladder is the consequence of distension of the organ by unheeded polyuria. Still another possibility is that both the paralysis and polyuria are the results of some single, unknown cause. But the probabilities are in favor of the assumption that the primary affection was the loss of the nerve impulse warning that the bladder is full and should be emptied. This assumption is sustained by the fact that the patient is constipated to an extent that suggests paresis of the intestinal muscles. In a second patient enuresis was the first symptom noted. Posner, therefore, believes that this ensemble constitutes a new affection, which he designates polyuria with paralysis of the bladder without mechanical cause.

**62. Anesthesin in Treatment of Wounds.**—Lengemann reports that anesthesin has been extensively used at von Mikulicz' clinic and with extremely favorable results. It was principally employed externally as a local anesthetic for granulating surfaces before cauterizing them with the nitrate of silver pencil. It was strewed on the surface as a dry powder and in a few minutes the part had lost its sensitiveness. It was also used to dust painful ulcerating carcinomata, etc., and always with fine results.

**63. Atypical Manifestations in Course of Secondary Syphilis.**—In this communication from Erb's clinic a case is related among others in which it was difficult to decide whether the affection was a recurring exanthem in scarlet fever or a recurring mercurial scarlatiniform erythem.

**64. Conjugal Cancer and Statistics of Cancer.**—Radestock has observed two cases of "cancer à deux." In one case the wife died with cancer of the ovary on a hereditary foundation and seven years afterward the husband, 55 years of age, became affected with cancer of the intestines. In the second case the wife died in consequence of a rapidly developing malignant neoplasm of the esophagus. Three weeks after her death the husband began to complain of similar disturbances and soon died with evidences of a cancer of the esophagus at about the same point. Radestock does not believe in the contagious character of cancer, but admits that this latter case is curious. He has been making an investigation in regard to the occupation of the persons less than 41 years of age who have succumbed to cancer in the last ten years in his district. He found that 49 out of a total of 452 persons dying from cancer—1890 to 1893—were between 30 and 41. Of this number, 17 were men; 10 were workers on iron and 9 of these were affected with carcinoma of the stomach. He also found that 95 out of 846 deaths from cancer reported between 1894 and 1899 were persons of this age, and 13 of the 31 men were workers on iron. Ten of these 13 had been affected with carcinoma of the stomach, 2 of the esophagus and in 1 the site was not mentioned. Another curious fact is that no person employed in the manufacture of textiles could be found in the list of cases of carcinoma under 41.

**66. Costal Sign of Enteroptosis.**—Stillier reiterates his previous statements in regard to the value of the sign of the floating rib for the diagnosis of enteroptosis, nervous dyspepsia and neurasthenia. It enlightens the specialist in stomach dis-

eases as to the nature of the dyspepsia observed and enables him to distinguish between the organic and the functional forms, between the congenital and the acquired tendency. It is a positive sign for the neurologist, and reveals the congenital basis for the dyspeptic form of the neurasthenia. It is a guide for the gynecologist by which he is able to distinguish between genuine enteroptosis and the ptosis induced by purely mechanical causes. It indicates that displacements of the uterus in such cases are only partial manifestations of the general tendency and that this and not the displacement of the uterus is the cause of the nervous-dyspeptic disturbances. The costal sign is also a valuable guide in pediatrics as it warns to use extra exertions to preserve children thus stigmatized from the neurasthenia and nervous dyspepsia to which they are otherwise doomed.

**67. Subcutaneous Injections of Yohimbin.**—Lulenburg has used yohimbin extensively in his practice and states that it has proved invariably successful in curing neurasthenic impotency in his experience. It is more certain and reliable in its action administered in subcutaneous injection.

**68. Anesthesin.**—Dunbar recommends anesthesin which is the ester of para-amido-benzoic acid, as not only a substitute for cocaine but as a local anesthetic far surpassing the latter in its effects while it is absolutely non-toxic. He injects into or beneath the skin the following combination: Anesthesin hydrochlorate, .25; sodium chlorate, .15; morphin hydrochlorate .015, and aqua dest., 100. The anesthesia induced is the most perfect that it is possible to conceive, he states, while it persists at its height for more than thirty minutes. The solutions are stable and the favorable way in which wounds heal after its application suggests that it may possess certain antiseptic properties. He recommends it urgently to all surgeons.

## Books Received.

Acknowledgment of all books received will be made in this column, and this will be deemed by us a full equivalent to those sending them. A selection from these volumes will be made for review, as dictated by their merits, or in the interests of our readers.

**AMERICAN EDITION OF NOTHAGEL'S ENCYCLOPEDIA.** Diphtheria. By Wm. P. Northrup, M.D., of New York. Measles, Scarlet Fever, and German Measles.—By Professor Dr. Th. von Jurgensen, Professor of Medicine in the University of Tubingen. Edited, with Additions, by William P. Northrup, M.D., Professor of Pediatrics in the University and Bellevue Medical College, New York. Handsome Octavo, 672 Pages, Illustrated, including 24 Full-page Plates, 3 of Them in Colors. Cloth, \$5.00 net; Half Morocco, \$6.00 net. Philadelphia and London: W. B. Saunders & Co. 1902.

**MINOR SURGERY AND BANDAGING,** including the Treatment of Fractures and Dislocations, the Ligation of Arteries, Amputations, Excisions and Resections, Intestinal Anastomosis, Operations upon Nerves and Tendons, Tracheotomy, Intubation of the Larynx, etc. By Henry R. Wharton, M.D., Professor of Clinical Surgery in the Woman's Medical College of Pennsylvania. Fifth Edition, Enlarged and Thoroughly Revised, with 509 Illustrations. Cloth. Pp. 621. Price, \$3.00. Philadelphia and New York: Lea Brothers & Co. 1902.

**THE NEUROSES OF THE GENITO-URINARY SYSTEM IN THE MALE, WITH STERILITY AND IMPOTENCE.** By Dr. R. Uitzmann, Professor of Genito-Urinary Diseases in the University of Vienna. Second Edition. Revised, with Notes and a Supplementary article on Nervous Impotence, by the translator, Gardner W. Allen, M.D., Surgeon in the Genito-Urinary Department of the Boston Dispensary; Illustrated. Pp. 198. 12mo. Price, Extra Cloth, \$1.00 net, Delivered. Philadelphia: F. A. Davis Company. 1902.

**A PRACTICAL TREATISE ON SMALLPOX.** Illustrated by Colored Photographs from Life. By George Henry Fox, A.M., M.D., Consulting Dermatologist to the Health Department of New York City. With the Collaboration of S. D. Hubbard, M.D., S. Pollitzer, M.D., and J. H. Huddleston, M.D. In Two Parts. Price, \$3.00. Philadelphia and London: J. B. Lippincott Co. 1902.

**DISEASES OF THE NOSE, PHARYNX, AND EAR.** By Henry Gradle, M.D., Professor of Ophthalmology and Otology, Northwestern University Medical School, Chicago. Handsome Octavo of 547 Pages. Profusely Illustrated, including Two Full-page Plates in Colors. Cloth, \$3.50 net. Philadelphia and London: W. B. Saunders & Co. 1902.

**THE PRACTITIONER'S MANUAL: A Condensed System of General Medical Diagnosis and Treatment.** By Charles Warren Allen, M.D., Consulting Genito-Urinary Surgeon to the City (Charity) Hospital. Second Edition. Revised and Enlarged. Cloth. Pp. 889. Price, \$6.00. New York: William Wood & Co. 1902.

**PRACTICAL DIETETICS,** with Special Reference to Diet in Disease. By W. Gilman Thompson, M.D., Professor of Medicine in the Cornell University Medical College in New York City. Second Edition. Enlarged and Thoroughly Revised. Cloth. Pp. 828. Price, \$5.00. New York: D. Appleton & Co. 1902.

**A PHYSICIAN'S PRACTICAL GYNECOLOGY.** By W. O. Henry, M.D., Omaha, Neb., Professor of Gynecology in the Creighton Medical

College. With Five Full-page Illustrations and Sixty-one Illustrations in the Text. Cloth. Pp. 229. Price, \$2.00. Lincoln, Neb.: The Review Press. 1902.

**A LABORATORY GUIDE IN ELEMENTARY BACTERIOLOGY.** By William D. Frost, M.S., Instructor in Bacteriology, University of Wisconsin. Illustrated. Second Revised Edition. Cloth. Pp. 353. Price, \$1.50. Madison, Wis.: Published by the Author. 1902.

**TRANSACTIONS OF THE AMERICAN PEDIATRIC SOCIETY,** Thirteenth Session, Held at Niagara Falls, N. Y., May 27, 28 and 29, 1901. Edited by Walter Lester Carr, M.D. Volume XLIII. Cloth. Pp. 294. Reprinted from Archives of Pediatrics. 1901.

**FIFTEENTH BIENNIAL REPORT** of the Superintendent of the Iowa Hospital for the Insane at Independence to the Board of Control of State Institutions for the Period Ending June 30, 1901. Paper. Pp. 63. Dubuque: Telegraph-Herald. 1902.

**A TEXT-BOOK OF INSANITY.** By Charles Mercier, M.B., M.R.C.P., F.R.C.S., Lecturer on Insanity at the Westminster Hospital. Cloth. Pp. 222. Price, \$1.75. London: Swan Sonnenschein & Co., Ltd. New York: The Macmillan Co. 1902.

**TRANSACTIONS OF THE SOUTHERN SURGICAL AND GYNECOLOGICAL ASSOCIATION.** Volume XIV. Fourteenth Session, Held at Richmond, Va., Nov. 12, 13 and 14, 1901. Cloth. Pp. 435. Published by the Association. 1902.

**MEDICO-CHIRURGICAL TRANSACTIONS.** Published by the Royal Medical and Chirurgical Society of London. Volume LXXXIV. (Second Series, Volume LXVI. Cloth. Pp. 564.) London: Longmans, Green & Co. 1901.

**A CATALOGUE OF THE OFFICERS AND FELLOWS,** of the Massachusetts Medical Society, Honorary, Active and Retired, Borne upon the Rolls. Jan. 1, 1902. Paper. Pp. 142. Boston: Published by the Society.

**SECOND ANNUAL REPORT OF THE NATIONAL JEWISH HOSPITALS FOR CONSUMPTIVES,** at Denver, Colo., 1901. Paper. Pp. 95.

## Queries and Minor Notes.

AMERICAN FORK, UTAH, June 3, 1902.

*To the Editor:*—In one of the back numbers of THE JOURNAL, I saw that you reported two medical colleges that are recognized which offer a three-years' course instead of four. You would favor me by sending the addresses of those colleges. H. E. R.

*Ans.*—We know of no medical college of any importance that continues to give degrees after 1902 after only a three-year course. There is but one, the N. C. Medical College, a small institution in a small town, Davidson, N. C., that so far as we know has not announced a change to a four-year course.

## New Patents.

Patents of Interest to Physicians, etc., May 20 and 27:

700,631. Modified milk and obtaining same. Emil von Dungern, Frankfurt-on-the-Main, Germany.

700,528. Inhaler with nasal attachment. George H. Maurer, Washington, D. C.

700,232. Portable inhaling apparatus. Jean Planeur and L. Dutremblay, Paris, France.

700,370. Pill machine. Wm. Rabich, St. Louis.

700,561. Medical cabinet. Winfield S. Rowley and L. B. Freeman, Indianapolis.

701,124. Vaginal syringe. Charles F. Allen, Hueneme, Cal.

701,130. Apparatus for testing the volume of air from the lungs. Michael Benedict, New York City.

700,728. Binaural stethoscope. Robert C. M. Bowles, Boston.

700,733. Pocket spittoon. Richard Buettner, Brooklyn, and X. Marx, New York City.

701,185. Electrotherapeutic apparatus. George W. Euker, Richmond, Va.

700,938. Bandage. Robert W. Johnson, New Brunswick, N. J.

700,939. Surgical absorbent dressing. Robert W. Johnson, New Brunswick, N. J.

700,940. Bandage. Robert W. Johnson, New Brunswick, N. J.

700,783. Galvano-electric therapeutic chain. August Kruger, Stettin, Germany.

701,075. Catheter or the like instrument. Richard P. McCully, Brooklyn.

701,070. Nursing bottle. John W. Minwegen, Chicago.

700,805. Capsule. George H. Paine, Germantown, Pa.

700,806. Manufacture of capsules. George H. Paine, Germantown, Pa.

700,838. Atomizer. Cyrus J. Seltzer, Philadelphia.

700,995. Air-forcing device for atomizers. Charles J. Walz, New York City.

## The Public Service.

### Army Changes.

Movements of Army Medical Officers under orders from the Adjutant-General's Office, Washington, D. C., May 29 to June 4, 1902, inclusive:

James K. Ashburn, contract surgeon, member of an examining board at Omaha, Neb., vice Lieut.-Col. Charles K. Winne, deputy surgeon-general, relieved.

Wilmont E. Brown, contract surgeon, now at Coolville, Ohio, to duty at Fort Casey, Wash., to relieve Contract Surgeon William M. Hendrickson.

Robert P. Cooke, contract surgeon, now at Jefferson Barracks, Mo., to report for duty at Fort H. G. Wright, N. Y.

Walter Cox, lieutenant and asst.-surgeon, U. S. A., from Washington, D. C., to duty at Fort Banks, Mass.

William D. Crosby, major and surgeon, U. S. A., member of a board at Fort Barrancas, Fla., to examine officers of the Army for promotion.

Thomas Devereux, contract surgeon, now at Minneapolis, Minn., to report for duty at Fort Snelling, Minn.

Haywood S. Hansell, contract surgeon, now at Atlanta, Ga., to report for duty at Fort McPherson, Ga.

Herbert I. Harris, contract surgeon, to duty with troops at Chickamauga Park, Ga.

Philip F. Harvey, lieutenant-col. and deputy surgeon-general, relieved from further duty in the Division of the Philippines, to proceed to San Francisco, and report to the Adjutant-General of the Army for further orders. William M. Hendrickson, contract surgeon, on being relieved from duty at Fort Casey, Wash., to return to his home at Wrangell, Alaska, for annulment of contract.

John H. Hless, supervising dental surgeon, to represent the Dental Corps of the Army at the annual meeting of the National Dental Association to be held at Niagara Falls, N. Y., July 26, 1902.

Jefferson R. Kean, major and surgeon, U. S. A., relieved from further duty in the Department of Cuba, to take station in Washington, D. C., until further orders.

Thomas J. Kirkpatrick, captain and asst.-surgeon, U. S. A., member of a board at Fort Barrancas, Fla., to examine officers of the Army for promotion.

Samuel A. Maxwell, contract surgeon, now at Trinidad, Colo., to report for duty at Fort Grant, Ariz.

Charles F. Morse, contract surgeon, now at Montpelier, Vt., to report for duty at Fort Ethan Allen, Vt.

George J. Newgarden, captain and asst.-surgeon, U. S. A., on being relieved from duty at Fort Mason, Cal., to report for transportation to Manila, P. I., for duty in the Division of the Philippines.

Shannon Richmond, captain and asst.-surgeon, Vols., having tendered his resignation, is honorably discharged from the service of the United States, to date from May 31, 1902.

John W. Ross, U. S. Navy, retired, is relieved from duty under the War Department, to take effect June 15, 1902, when he will report in person to the Secretary of the Navy.

Cary R. Snoddy, contract surgeon, now at Nashville, Tenn., to duty at Fort Thomas, Ky.

Henry D. Snyder, captain and asst.-surgeon, U. S. A., to report June 9, 1902, to Colonel Calvin DeWitt, assistant surgeon-general, president of the examining board convened at the Army Medical Museum Building, Washington, D. C., to determine his fitness for promotion.

William Stephenson, major and surgeon, U. S. A., relieved from further duty in the Division of the Philippines, and will proceed to Fort Mason, Cal., to relieve Captain George J. Newgarden, asst.-surgeon, U. S. A.

James S. Wilson, major and surgeon, Vols. (captain and asst.-surgeon, U. S. A.), relieved from further duty in the Division of the Philippines, and will proceed to San Francisco, and on arrival will telegraph to the Adjutant-General of the Army for orders.

### Navy Changes.

Changes in the Medical Corps of the Navy, for the week ending June 7, 1902:

Medical Inspector E. H. Green, detached from duty as a member of the Medical Examining Board, Washington, and ordered to the Wisconsin as fleet surgeon of the Pacific Station.

P. A. Surgeon D. B. Kerr, detached from the Boston Navy Yard, June 5, and ordered to duty with a recruiting party.

Surgeon H. T. Percy, detached from the Naval Recruiting Rendezvous, Philadelphia, Pa., and ordered to the Indiana.

Surgeon C. Biddle, detached from the Indiana, and ordered to the Naval Recruiting Rendezvous, Philadelphia.

Surgeon John W. Ross, retired, relieved from duty with the War Department in Cuba, to take effect June 15, and to report to the Secretary of the Navy on that date.

### Marine-Hospital Changes.

Official list of the changes of station and duties of commissioned and non-commissioned officers of the U. S. Marine-Hospital Service for the fourteen days ended June 5, 1902:

Surgeon Preston H. Ballhache, leave of absence for five days from May 21, 1902, under paragraph 179 of the regulations. Bureau letter of May 10, 1902, directing Surgeon Ballhache to represent the service at meeting of American Congress of Tuberculosis, at New York City, revoked. Detailed to represent service at meeting of American Medical Association, at Saratoga Springs, N. Y., June 10 to 13.

Surgeon G. W. Stoner, detailed to represent service at meeting of American Congress of Tuberculosis, at New York City, June 2, 3, 4.

Surgeon A. H. Glennan, detailed for duty in office of U. S. Consul-General, at Havana, Cuba.

Surgeon P. M. Carrington, granted leave of absence for fifteen days from June 6, 1902; fifteen days' leave of absence granted by Bureau letter of May 2, 1902, revoked. Detailed to represent service at meeting of American Medical Association, at Saratoga Springs, N. Y., June 10 to 13; upon completion of detail to rejoin station via Washington, D. C.

Surgeon L. L. Williams, detailed to represent service at meeting of Association of Military Surgeons, at Washington, D. C., June 5, 6, 7.

Surgeon G. T. Vaughan, detailed to represent service at meeting of Association of Military Surgeons at Washington D. C., June 5, 6, 7.

Surgeon J. O. Cobb, granted leave of absence for fifteen days from June 6.

P. A. Surgeon Rupert Blue, to proceed to Sheboygan, Wis., for special temporary duty.

P. A. Surgeon J. L. Greene, to proceed to Immigration Depot, New York City, and report to Surgeon R. W. Stoner for temporary duty.

P. A. Surgeon Hill Hastings, to proceed to Cananea, Mexico, for special temporary duty.

Asst.-Surgeon John McMullen, granted five days' extension of leave of absence from May 29.

Asst.-Surgeon H. C. Russell, granted leave of absence for one week from May 24, 1902, under paragraph 181 of the regulations. Granted two weeks' extension of leave of absence from May 30.

Asst.-Surgeon R. H. von Emdorf, detailed for duty in the Division of the U. S. Consul-General at Havana, Cuba, for duty at Matanzas.

Asst.-Surgeon F. E. Trotter, detailed for duty in the office of U. S. Consul-General, at Havana, Cuba.

A. A. Surgeon F. Duffy, Bureau letter of May 15, granting leave of absence for six days from May 19, amended so that said leave shall be effective May 28.

A. A. Surgeon S. B. Foster granted leave of absence for eight days.

A. A. Surgeon A. W. Slaughter, granted leave of absence for fourteen days from June 1.

A. A. Surgeon W. H. Marsh, granted leave of absence for sixteen days from June 3.

A. A. Surgeon E. L. Stewart, granted leave of absence for thirty days.

Junior Pharmacist W. C. Phillips, granted five days' leave of absence from May 11, 1902, under paragraph 201 of the regulations.

### BOARDS CONVENED.

Board convened at New Orleans, La., May 30, 1902, for the physical examination of an officer of the Revenue Cutter Service. Detail for the Board: P. A. Surgeon C. P. Wertenbaker, chairman; Asst.-Surgeon J. W. Schereschewsky, recorder.

Board convened at San Francisco, June 7, 1902, for the physical examination of officers of the Revenue Cutter Service. Detail for the Board: P. A. Surgeon W. G. Stimpson, chairman; P. A. Surgeon H. S. Cumming, recorder.

Board convened at Washington, D. C., June 12, 1902, for the physical examination of an officer of the Revenue Cutter Service. Detail for the Board: Surgeon G. T. Vaughan, chairman; Asst.-Surgeon B. S. Warren, recorder.

### Health Reports.

The following cases of smallpox, yellow fever, cholera and plague have been reported to the Surgeon-General, U. S. Marine-Hospital Service, during the week ended June 7, 1902:

#### SMALLPOX—UNITED STATES.

Colorado: Denver, May 17-24, 7 cases.  
Florida: Jacksonville, May 24-31, 1 case.  
Illinois: Chicago, May 24-31, 12 cases; Freeport, May 17-24, 4 cases.

Indiana: May 17-24, Indianapolis, 14 cases; Terre Haute, 1 case.

Kansas: Wichita, May 17-24, 5 cases.

Kentucky: Covington, May 24-31, 8 cases.

Louisiana: New Orleans, May 24-31, 2 cases.

Maine: Biddeford, Jan. 1-May 29, 2 cases.

Massachusetts: Boston, May 24-31, 23 cases, 3 deaths; Brockton, May 17-24, 1 case; Cambridge, May 10-31, 12 cases; Everett, May 24-31, 1 case; Lawrence, May 17-24, 2 cases; Malden, May 24-31, 3 cases; Melrose, May 24-31, 2 cases; Newbern, May 24-31, 2 cases.

Missouri: St. Louis, May 18-25, 25 cases.

Montana: Butte, May 18-25, 4 cases.

Nebraska: Omaha, May 17-31, 47 cases.

New Hampshire: Nashua, May 24-31, 2 cases.

New Jersey: Hudson County, including Jersey City, May 18-25, 36 cases, 1 death.

New York: Elmira, May 17-31, 1 case, 1 death; New York, May 24-31, 63 cases, 2 deaths.

Ohio: Cincinnati, May 23-30, 11 cases; Cleveland, May 17-31, 68 cases, 9 deaths; Hamilton, May 24-31, 2 cases; Toledo, May 17-24, 6 cases.

Pennsylvania: Erie, May 17-24, 2 cases; Johnstown, May 24-31, 2 cases; Philadelphia, May 24-31, 9 cases, 5 deaths.

Tennessee: Memphis, May 24-31, 12 cases.

Utah: Salt Lake City, May 17-24, 6 cases.

Vermont: Rutland, April 26-May 31, 13 cases, 1 death.

Washington: Tacoma, May 18-25, 1 case.

Wisconsin: Green Bay, May 18-June 1, 5 cases; Janesville, May 17-24, 2 cases; Milwaukee, May 17-31, 12 cases.

#### SMALLPOX—FOREIGN.

Austria: Prague, May 3-17, 8 cases.

Belgium: Antwerp, May 3-17, 14 cases, 4 deaths; Brussels, May 10-17, 1 death.

Canada: Halifax, May 17-31, 2 cases, 1 death; Quebec, May 3-24, 34 cases; Winnipeg, May 17-24, 2 cases.

France: Paris, May 10-17, 2 deaths.

Great Britain: Birmingham, May 10-17, 4 cases, 1 death; Glasgow, May 16-23, 4 cases; Liverpool, May 10-17, 1 case; London, May 10-17, 233 cases, 37 deaths.

India: Bombay, April 22-29, 7 deaths.

Italy: Naples, May 10-17, 5 cases.

Mexico: City of Mexico, May 11-25, 1 death; Vera Cruz, May 18-24, 1 case, 3 deaths.

Russia: Moscow, May 3-10, 16 cases, 1 death; Odessa, May 3-17, 15 cases, 3 deaths.

#### YELLOW FEVER.

Colombia: Panama, May 10, 8 cases, 6 deaths.

Mexico: City of Mexico, May 11-18, 1 death; Vera Cruz, May 18-24, 36 cases, 15 deaths.

#### CHOLERA—INSULAR.

Philippines: Manila, March 20-April 18, 278 cases, 208 deaths; Bataan Province, March 30-April 18, 241 cases, 166 deaths; Bulacan Province, March 30-April 18, 123 cases, 89 deaths; Camarines Province, March 30-April 18, 204 cases, 113 deaths; Cavite Province, March 30-April 18, 5 cases, 5 deaths; Ilocos Norte Province, March 30-April 18, 1 case, 1 death; Laguna Province, March 30-April 18, 29 cases, 30 deaths; Rizal Province, March 30-April 18, 47 cases, 34 deaths.

#### CHOLERA—FOREIGN.

India: Bombay, April 22-29, 2 deaths.

#### PLAGUE.

India: Bombay, April 22-29, 520 deaths; Karachi, April 26-May 4, 127 cases, 105 deaths.

## Original Articles.

### A CONTRIBUTION TO THE TREATMENT OF PNEUMONIA WITH ANTIPNEU- MOCOCCIC SERUM.\*

BRICE W. GOLDSBOROUGH, M.D.

Vice-President Medical and Chirurgical Faculty of Maryland; Chief  
of Staff United Charities Hospital.  
CAMBRIDGE, MD.

One can but feel a very natural hesitation in presenting to this society any views on the treatment of pneumonia, because I very fully realize that the experience of all of us must have been, in the treatment of this grave disease, one of disappointment and, at times, of despair. As for myself, during the past twenty odd years, I have, in my vain endeavor to save the lives of those intrusted to my care and who were the victims of this disease, used nearly all of the many treatments which have been suggested. Each fall I have read the views of my brethren in the great medical centers, have earnestly studied their methods, and with renewed hope and fresh courage I have again entered into the battle with this disease.

Each spring, looking back over the results of these various treatments and endeavoring to be honest with myself, I have been forced to the humiliating conclusion that none of these treatments were satisfactory. Many were saved, but the per cent. of mortality was so great that I was forced to confess that the treatment of this disease could very properly be placed among the opprobria of medicine.

It would be a waste of time to name the various treatments of pneumonia I have used, but if I did so it would at least demonstrate in some degree the spirit of dissatisfaction and unrest which has had possession of me, and, I believe, in a large measure, the whole profession. Where so many radically different treatments are recommended it can be generally said none are entirely satisfactory.

With these treatments, many of them diametrically opposed and some of them suggested mainly by empiricism and tradition, I have had the same unsatisfactory results, and from all the many treatments which have been recommended, I believe a careful investigation will show the same percentage of deaths.

Therefore, when, some years ago, Dr. William H. Welch read his memorable paper before this society on the subject of pneumotoxin and antipneumotoxin, I am sure I was not alone in once again taking fresh hope, and in feeling that a foundation had been laid upon which, in time, we should be able to build a rational

scientific treatment of this disease. In addition, I was so much impressed with the discussion and the conclusions then drawn that I felt that if the Johns Hopkins had done nothing else, this work alone would surely immortalize both the man and the university. I say this not yielding to any one my feeling of personal obligation for the marvelous leavening effect this school has had upon the medical profession of my state.

We have outgrown empiricism and tradition and, while I am fully aware the number of cases I have to report are few, the results have been to me astonishing and gratifying, and I am persuaded that any discussion upon so vital a subject cannot fail to be of use to all of us, and perhaps of some benefit to our patients.

During the past three years I have uniformly used the cold-water baths to reduce temperature in pneumonia. In cases where the temperature was exceedingly obstinate and stubborn and the baths were given with much shock, I have used small doses of antipyretics, but only in small doses, and only when the importunities of the patient and family rendered it practically impossible to give the cold-water baths. In the onset of this disease, unless otherwise indicated, I give a purgative. I use whiskey or brandy after the baths and moderate doses of strychnia, when indicated. In some of my cases where prostration was extreme, I used carbonate ammonia and digitalis. Occasionally I have given guaiacol or creosote. Milk and beef peptonoids were generally used for nourishment.

I mention these remedies, but I feel so confident of the curative effect of the serum administered early and in large doses, that, for myself at least, I should feel culpable to a great degree had I a case of pneumonia and failed to use the serum. In all the cases I report there was a marked change within eight hours of administration and in many there was a crisis successfully passed within forty-eight hours. As the serum in no way interferes with other remedies that might be used, there can be no legitimate excuse for not using it, and if this was done the combined experience of the profession would demonstrate, I believe, beyond all cavil, the wonderful curative effect of this remedy. I injected 20 c.c. of H. K. Mulford's serum and repeated in eight hours if there was not a very marked change for the better. I have used in some cases three injections, in others one was sufficient.

We cannot expect in cases of catarrhal or bronchopneumonia—with a possibility of a fixed infection—to obtain the same results as in cases of lobar pneumonia, but my own experience is that in such cases the serum is of great benefit.

The experiments of Prof. Victor C. Vaughan have shown the fact of the double toxin character of the

\* Read before the Medical and Chirurgical Faculty of Maryland, April 23, 1902.

pneumotoxin, but they have also shown that the antitoxin with the presence of one of these toxins is a specific, in the mixed toxin it has a marked beneficial effect—while in one it does not seem to act at all. The practical lesson, it seems to me, is that we should use the serum in all cases, as it is impossible to determine with just what exact type of toxin we are dealing.

The harmless action of the serum in all conditions is another strong reason for its use. In the tabulation there are 447 cases: some treated with antitoxin serum, some with blood from convalescents and 61 cases with antidiphtheritic serum. The percentage of deaths in the 386 cases treated with the antipneumococcal serum—to which may be added my own 9 cases with two deaths—gives a percentage of 16.5-10 per cent. The investigations of Dr. William Osler of the percentage of deaths from pneumonia in the various hospitals in America show that the best results obtained are 25 per cent., and in some instances as high as 35.

One of my cases was practically in extremis when treated, and the other was a patient already affected with a mortal disease. In many of the cases reported as fatal the serum was administered when the case was already hopeless and the tabulation and the results and conclusions drawn from it are by no means an absolutely fair presentation of the curative action of the serum in the treatment of pneumonia. The cases which have been treated with antidiphtheritic serum are simply reported as a striking instance of the fact that the minds of the profession, generally, all the world over are looking for some serum which seems to offer the only reasonable scientific method of successfully combating this disease. In conclusion, it appears to me that this remedy deserves a more thorough and a fairer trial at the hands of the profession.

CASE 1.—W. H. L., age 5, May 7, 1900, case of Dr. John Mace's, Cambridge, with an attack of broncho-pneumonia, subsequent to an attack of measles. When seen by me was in a deep stupor, with a temperature of 105, pulse 150, respiration 50, and in a state of extreme prostration. He was receiving the usual expectant treatment of pneumonia. I administered 20 c.c. of the serum, and in about eight hours there was a marked improvement in the patient's temperature, pulse and a return of consciousness. Notwithstanding the favorable action of the remedy and the request of both attending physicians, the family refused to permit of a second injection. The little patient relapsed again into his former condition and died May 12. Both lungs were involved in the inflammatory process.

CASE 2.—W. M., boy, aged 3, Feb. 6, 1901, broncho-pneumonia, both lungs involved, temperature 103 to 105, pulse 120 to 150, respiration so embarrassed that he had to be held in erect position, crepitation over lower lobes of both lungs, constant cough, expectoration free. At six o'clock p. m. 20 c.c. of the serum were administered and in six hours there was a marked change for the better. From this time on there was a gradual improvement in all the symptoms, and by the fifth day convalescence was established. The injection of the serum was followed by a rash which produced some discomfort, but disappeared in about forty-eight hours.

CASE 3.—Mrs. B. Mc., aged 24, confinement, Feb. 25, 1901, during an attack of influenza. Fourth day after confinement had chill, temperature, 105, pulse 120, rusty expectoration, cough and all the local signs of lobar pneumonia of the lower lobe of the right lung. Forty-eight hours afterward gave an injection of 20 c.c. of the serum. In eight hours there was a drop in the temperature. The patient had a fair night's rest. From this time there was a decline in all symptoms and in less than one week from the initial chill the temperature and pulse were normal and the patient was discharged.

CASE 4.—O. D., boy, aged 11, March 4, 1901. Had an attack of lobar pneumonia, lower lobe of both right and left lung in-

involved, chill, rusty sputa, cough, temperature 104, pulse 130, all the local signs of the disease were present. Forty-eight hours from the initial chill 20 c.c. of the serum were injected. In ten hours the fever was lowered and all the symptoms were improved. Convalescence was established in less than a week.

CASE 5.—E. M. W., girl, age 4 years. Lobar pneumonia, lower lobe of the right lung, Jan. 25, 1902, chill, fever from 101 to 104, pulse from 120 to 150, respiration from 30 to 40, cough and free expectoration, all the local signs of disease were present. Second day of illness, the diagnosis having been made, 20 c.c. of the serum were injected, but was not followed by any marked reaction. In about eight hours second dose was given, and this was followed by only slight improvement. The next morning the third injection was given, and by night temperature was normal and convalescence was very rapid. One week represented the whole period of professional services rendered.

CASE 6.—T. W. S., Jr., boy, aged 2 years, 9 months. Had an attack of pertussis and acute catarrhal bronchitis. Feb. 2, 1902, had a chill, broncho-pneumonia of the right lung developed. Temperature from 103 to 105, pulse 140, respiration was very rapid and labored, at times 60. Dilatation *alae nasi* was very marked, stupor was profound; with difficulty small quantities of nourishment were administered, 20 c.c. of the serum were injected the next day. In eight hours there was a rapid decline in temperature, pulse and respiration and a return of consciousness. I discharged the case the sixth day convalescent.

CASE 7.—R. R., youth, aged 19, lobar pneumonia, lower lobes both lungs, temperature at first visit 105 4/5, pulse 140, cough frequent, expectoration very bloody, some pain over right lung, all local signs of disease were present. Twenty c.c. of the serum were injected in the afternoon, which injection in eight hours was followed by a marked decline in the intensity of the symptoms, but I gave him a second injection, and on the fifth day of the disease the temperature was normal and convalescence was established.

CASE 8.—C. H. K., male, aged 62, was admitted to the Charity Hospital, Cambridge, Jan. 28, 1902, with a osteo-sarcoma of tibia. The glandular system was pretty generally involved. The odor was indescribable and the mass was everted, with a hope of relieving this condition; finally, for relief of pain and other reasons, an amputation of thigh was done February 7. February 23, lobar pneumonia of the lower lobe of the right lung developed with all the local signs and constitutional symptoms. The following day the lower lobe of the left lung became involved. Three injections of the serum, at intervals of eight hours, were given, with some slight improvement, but the patient died March 4, 1902. We considered it more than probable that we were dealing with a case of metastasis.

CASE 9.—S. J., boy, aged 6 months, had an attack of acute catarrhal bronchitis, March 24, 1902, became worse and I was called to see him, rectal temperature 105, pulse 150, respiration 50 and very labored, complete loss of voice, absence of cough, at times respiration was so difficult that it seemed the patient would be asphyxiated. A chest examination revealed the presence of broncho-pneumonia of both lungs. No lesion in nose or pharynx, a diagnosis of laryngeal diphtheria and subsequent broncho-pneumonia was made; 2000 units of diphtheria antitoxin were injected, and three hours later 20 c.c. of pneumonia antitoxin were injected. I fully expected to be compelled to intubate this case, but there was a gradual improvement of all the symptoms, though I was compelled to repeat the injection of diphtheria antitoxin three times. This case recovered after an illness of two weeks. No other treatment was given save stimulants and cold-water baths to reduce temperature.

**German Physicians Recommend Cremation.**—Several thousand German physicians have signed a petition to the Reichstag asking that the burning of bodies of persons dying of contagious diseases should be made obligatory.—*Medical Age.*

# ON THE IMMUNIZATION TREATMENT OF HAY FEVER.\*

E. FLETCHER INGALS, M.D.  
CHICAGO.

Prompted by the favorable reports of Dr. H. Holbrook Curtis upon his so-called immunization treatment of hay fever by the *Ambrosia artemesiefolia*, my associate, Dr. John Edwin Rhodes, and myself last summer decided to give the treatment a careful trial. We tried to obtain from the leading druggists in this city reliable preparations of the drugs, but found they were not kept in stock and therefore we corresponded with some manufacturing chemists with a hope of obtaining the desired remedies, but were unsuccessful. Parke, Davis & Co. had no preparation from either of the plants, but agreed to make a collection during the flowering season and prepare fluid extracts at once. However, these were not obtained in time for the trial. Subsequently, Mr. Baker, of the firm of Gale & Blocki, agreed to have the fresh ambrosia collected as soon as the flowering season came on and make from it a fluid extract which could be prepared in time for the latter part of the hay fever season. He found in their stock a fluid extract of the *Solidago odora* (golden rod) prepared by Wyeth & Co. Later he discovered in the city a normal tincture of *Ambrosia artemesiefolia* prepared by Merrill & Co. which is equivalent to a fluid extract. Dr. Curtis stated that by trying various substances he found that if a patient was rendered immune to one, he was thereby also made immune to some of the others. Curtis employed only the liq. ambrosiæ prepared by Fraser & Co., the constituents of which are not given.

## PHYSIOLOGIC PROPERTIES.

As many patients are affected by the pollen from golden rod, it appeared to us best to use preparations from both this and the ragweed, instead of relying upon either one alone. By referring to the literature, I found in the U. S. Dispensatory and in King's American Dispensatory that the *Solidago odora* was formerly used in the treatment of flatulent colic, amenorrhea, nausea, dysentery, diarrhea, cholera morbus, etc., and that it was sometimes added to nauseating medicine for the purpose of rendering it more agreeable to the taste. It was credited with carminative and diuretic properties and the preparation from the flowers was said to be aperient, astringent and diuretic.

As it is stated in the U. S. Dispensatory that this preparation has been recommended in the treatment of amenorrhea, it is interesting to note that one patient claimed that the medicine had caused menorrhagia. With the occurrence of the excessive flow, she had discontinued the medicine and upon repeatedly recommencing its use, the menorrhagia had as frequently reappeared so that she was obliged to stop its use altogether.

The dose of the infusion made with one ounce of the plant to the pint of water was from one to two fluid ounces which would equal m.xxx-lx of the fluid extract.

The *Ambrosia artemesiefolia* (Roman wormwood, ragweed or hogweed) appears to have similar effects to those of *Ambrosia trifida* (tall ambrosia or great ragweed) which is reputed by eclectics to be slightly stimulant, astringent, hemostatic and antiseptic. It is said to have been successfully employed in bleeding from the nose and other hemorrhagic discharges where the flow is of small amount. It has also been employed for the relief of hysteria and other nervous disorders.

*Ambrosia artemesiefolia* is said to be very useful in hemorrhoidal tumors and in some forms of ulcers and it has been used as a tonic after intermittent fever and to alleviate mucous discharges. The dose is given as from one to two fluid ounces of an infusion, repeated in from one to four hours. This is prepared with ½ ounce of the tops to a pint of water. This would equal m. xv-xxx of the fluid extract. It is thought that it would prove fully as efficacious if not more so than *Ambrosia trifida*.

Before we discovered the preparations, the hay fever season was so nearly upon us that some of our patients were clamoring for relief. To one of these I gave Fraser's liq. ambrosia with careful instruction for its use, but he happened to be a man peculiarly susceptible to the influence of drugs, from some of which he had previously experienced unpleasant symptoms. After taking a few doses of the liquid, his stomach was disturbed and he felt uncomfortable sensations which appeared to him like those he had formerly experienced from taking an opiate; therefore, he declined to take it. As we were not familiar with the composition of this liquid, we could not urge its continuance,\* but within a few days we secured the preparations above referred to and decided to administer them together, but free from any other drugs, hoping thereby to obtain some accurate information for the benefit of hay-fever sufferers. With this in view, I wrote to 100 of my hay-fever patients from whom I thought it likely that I could obtain reports, suggesting that they give the so-called remedy a trial. I stated frankly that it was an experiment in which I hoped for their coöperation. I stated that the medicine had been highly recommended for hay fever, but that I could not promise definite results, although I could assure them that no injury would follow the trial. So much time had been expended in searching for the remedies that about this time the hay-fever season had begun and consequently many of the patients had already gone away for the summer to escape the attack. Some of those to whom I wrote were afraid to try the experiment and thus it turned out that only 20 attempted the treatment.

## METHOD OF ADMINISTRATION.

In order that the investigation might be carried out accurately, each of these patients was supplied with medicine from the same lots which were secured by Gale & Blocki and the two fluid extracts were combined in equal proportion in all cases. The patients were directed to take a dose of the mixture about 10 minutes before each meal and one at bedtime, each dose to be followed with a free drink of water to prevent any possible disturbance of the stomach. They were given medicine droppers with which the medicine was to be measured, the droppers having first been tested so that it was found that 3 drops of the mixture equaled one minim. They were directed to drop the medicine into an empty capsule just before taking, which was thought to be the pleasantest means of administration, or they were allowed to take it upon a lump of sugar, in water, or in a little tea or coffee, as they preferred. The first dose of the medicine was to be 6 drops (2 minims); each succeeding dose was at first directed to be 2 drops larger, but shortly afterward it was made 6 drops (2 minims) larger until an adult patient reached the maximum dose of 60 drops (20 minims) of the combined fluid extracts.

\* Prof. J. W. Salisbury of Rush Medical College subsequently made a thorough examination of this liquid and failed to discover opiates, cocaine, hyoscyamine or atropin; therefore, the patient's symptoms probably were not dependent upon the medicine.

\* Read before the American Laryngological Association, Boston, May, 1902.

In a few cases the dose was increased to 30 minims 4 times daily.

The patients were directed to continue the remedy for a week or two, providing it acted favorably. Then if no symptoms of the disease were present it was to be discontinued, but it was to be taken again upon the first appearance of any symptoms of the affection. They were directed, farther, that if at any time the remedy caused disagreeable sensations in the stomach, or elsewhere, the dose should be diminished at once but subsequently gradually increased again, and each was asked to keep a careful record whether favorable or unfavorable, of the pulse, temperature, the condition of the digestive organs and the symptoms referable to the eyes, nose, throat or lungs.

#### ACCESSORY LOCAL TREATMENT.

In my desire to give these patients relief and believing that a local application might be helpful, I also gave these patients the adrenalin in a prescription as follows:

|   |          |
|---|----------|
| R. Resorecin .....                          | grs. v   |
| Adrenals (Armour's) (vel. adrenalin chlorid |          |
| grs. ss) .....                              | .3ii     |
| Acid boric .....                            | grs. xvi |
| Aqua camphor, hot .....                     | 3½       |
| Glycerin .....                              | 5½       |
| Aqua. dest., hot, q. s. ad.....             | .3ii     |

Macerate for four hours, then filter. Sig.: Use as a spray to nose and eyes 5 or 10 times a day when needed.

This was also to be used half as often throughout the hay-fever season even when there was no irritation. At first, with a view to local immunization, I directed the patients to add to each ½ ounce of the spray about 1-3 of a minim of the internal remedy and to increase the quantity each day about 1-3 of a minim until 6 minims had been added to the ½ ounce. Before long I became convinced that this was an irritant and did no good; therefore, it was discontinued.

#### COLLECTION OF THE DATA.

At the close of the hay-fever season, I sent to each of these patients the following letter and enclosed a list of numbered questions which would aid them in giving me systematic information upon the desired points.

#### THE LETTER TO PATIENTS.

Mr. \_\_\_\_\_ OCTOBER 29, 1901.

Dear Sir:—Now that the hay fever season for 1901 is over, I desire to obtain all possible information pro and con about the remedies we have been trying this summer for relief of the disease. I desire to publish this information for the use of the profession and the benefit of the public, but of course shall not publish names.

Will you kindly send me as soon as practicable careful answers to the questions on the enclosed sheet. Please number answers to compare with questions. I hope you will give me your unbiased views whether favorable or unfavorable to the remedy, as my only object is to record the actual facts for the benefit of others. In recording your impressions, it is necessary to take into consideration the weather and the condition of other hay fever patients in your vicinity at the time as well as your own experience during former years.

Yours very truly, E. FLETCHER INGALS.

1. Sex. Age. Occupation.
2. What year were you first affected with hay fever?
3. What has appeared to you to be the cause of the disease in your own person and what conditions or objects have been most active in exciting its paroxysms?
4. Have you had it every year since first attacked; if not, what years have you escaped?
5. Have your various attacks been mild, moderate, or severe?
6. To what do you attribute your escape from the attacks, or mildness of the symptoms during any of these years?

7. What have been your prominent general or special symptoms during the various attacks?

8. How have the attacks begun?

9. At what date?

10. At what date have your symptoms usually subsided?

11. How constant have your symptoms been during the hay-fever season during previous years?

12. Have you had asthma with these attacks?

13. If so at what time has it usually appeared and disappeared?

14. How was it influenced this season by the remedies?

15. Have you suffered any sequelæ after heavy frosts have checked the acute symptoms; if so, what have been your symptoms?

16. What symptoms had you of the disease this season and on what dates?

17. Has your pulse or temperature shown the presence of fever; if so, how much and how often?

18. At what time did you begin the use of the two special remedies that we have employed this year?

19. How have the remedies affected your appetite, digestion, nervous system, strength or general feeling?

20. Did you or did you not get relief from either or both of them?

21. What amounts of either or both were you using at the time of relief or apparent ineffectiveness of the remedies?

22. What have been your special experiences with either or both of the remedies in small or large doses; or in recommencing their use after they had been discontinued?

23. Do they appear to you to have prevented, retarded or cured the paroxysm of the disease?

24. What is your final estimate of the remedial value of these remedies?

25. In what manner have you taken the internal remedy?

26. Have you been annoyed by its taste; if so, have you discovered any agreeable way of taking it?

27. With what regularity have you employed these remedies?

#### RESULTS OF THE TREATMENT.

I have received replies from 18 of these and from two others I have been unable to obtain any information, although 2 or 3 letters have been written to each of them. Twelve, or 67 per cent., of these assert that they were relieved by the internal remedies. In several cases as the symptoms subsided, the medicine was discontinued, whereupon the symptoms reappeared, but again speedily disappeared upon recommencing the use of the medicine. Thirteen, or 72 per cent., believed they were benefited by the spray, while some found it deleterious, and one found it injurious, even when it contained none of the fluid extract. Sixty per cent. of the whole number were subject to asthma during the attack and just half of these reported benefit or entire relief from the asthmatic symptoms as a result, as they believed, of the internal medicines. Three, or 17 per cent., were benefited, but felt doubtful whether it was due to changes in the atmosphere or to the medicine and the same number asserted that they were unable to observe any effects whatever from the drugs. Of these last, however, all three report their trouble as severe, rather than mild or moderate, while one was also an asthmatic. In two cases it caused disturbance of the stomach and in one, already cited, it appeared to cause menorrhagia.

Some of the patients had few or no symptoms of hay fever until some time after the hay-fever season usually began with them, which at first it was hoped was due to the remedies, but the subsequent development of the symptoms led part of these to believe the medicines were of no value.

#### POLLEN OF OTHER PLANTS A FACTOR.

When we remember that the pollen of other plants besides the two used in this experiment may also be the

exciting cause of hay fever in certain cases, the failure to obtain relief by some of these patients does not supply positive proof that the extracts of solidago and ambrosia are not beneficial, for it is possible that with these patients the negative results might have been avoided had we added to the remedies the fluid extracts from various other blossoms, such as those of Indian corn, timothy, June grass, etc.

In some of the persons experimented on, the dosage may have been much too small, yet in others an attempt to increase the dose appeared to disturb the digestive organs. It will be remembered that the minimum dose of this mixture was only  $\frac{1}{22}$  of the minimum dose recommended by authors for the administration of these drugs, and that the dose we employed of these 2 fluid extracts was less than  $\frac{1}{4}$  of the average maximum doses of the two as recommended by the authors consulted.

#### OTHER EFFECTS OF THE REMEDIES.

It will be observed that in the literature, the preparations of golden rod are reputed to possess diaphoretic properties. Some of these patients noticed peculiar sweating while taking the medicine, similar to that they had experienced in former years during the beginning of the hay fever. Solidago has been used as a febrifuge. Some of these observers believe that the remedy prevented the burning sensation from which they had suffered in former years during the hay fever. Ambrosia is classed by the eclectics as a hemostatic, especially valuable in epistaxis. The same property may possibly account for the dryness of the nasal mucous membrane experienced by some of the persons who used these remedies, a property, by the way, which if found to be constant would make this a useful remedy not only in hay fever, but in some other disorders affecting the nasal mucous membrane.

#### ETIOLOGY IN THESE PATIENTS.

Of the 12 patients who believed themselves benefited by the remedy, 3, or 25 per cent., attributed the attacks to ragweed, none to golden rod and 9, or 75 per cent., to other things, as car smoke, odor of flowers and weeds, night air, dusty weather, dust from grain and new-mown hay. Of the patients who experienced no relief, 3, or 50 per cent., attributed the attack to ragweed, 2, or 33 per cent., to golden rod, and 1, or 17 per cent., to other things, such as damp, warm or cloudy weather. Of these getting relief, 5, or 42 per cent., report their cases as severe, 5, or 42 per cent., moderate, and 2, or 17 per cent., as mild to moderate. The shortest time with these patients during which they had been subject to hay fever was 3 years and the longest 30 years; 6, or 50 per cent., being less than 10 years' duration, and 6, or 50 per cent., above 10 years; 9, or 75 per cent., were of 7 years' or more duration. Of those not obtaining relief, all state their cases as severe and the duration was 9 to 25 years. Of those relieved by the medicine, in 9 cases, or 75 per cent., the trouble had returned every year since its commencement, while in only 3, or 25 per cent., of the cases had there been years when the symptoms did not appear, 2 of these being explained by the patients going to Europe during the hay-fever season. Of those not relieved, all had had the symptoms return every year with the hay-fever season.

#### RELIABLE PREPARATION OF DRUG NEEDED.

These remedies are used very little in medicine, therefore doubt arises as to the effectiveness of the preparations employed. It is not improbable that the particular lots that we experimented with had been in stock many years and may have lost their virtue. It would appear necessary that the plant in order to furnish an effective

remedy should be gathered during the flowering season, whereas with the remedies we employed, it is not unlikely that but little care was taken in selecting the crude plant. Fraser's liq. ambrosia is a proprietary preparation, the constituents of which are not known to the profession; therefore, careful physicians will hesitate to recommend it, and when it is taken no one can know certainly to what its good or ill effects may be due.

#### PLANS FOR FURTHER TRIAL.

From these considerations, I was induced to urge Parke, Davis & Co. to prepare standard fluid extracts from both of these plants gathered during the flowering season. This they have done so that they may be employed next summer. In order to make the administration as easy and pleasant as possible for the patient, they have at my request also put up the remedies in chocolate-coated tabloids of the fresh extract, of two sizes; each of the smaller tablets represents  $2\frac{1}{2}$  minims of each of the fluid extracts. These are to be used at the beginning and while the dose is being increased; the larger tablets each represent 10 minims of each of the fluid extracts which is the full dose that was generally employed by us during the past year, although twice this quantity might well be tried. The manufacturers assure me that the remedies will be quite as effective in this form as in any other and therefore with the quality assured and the administration made easy, we hope to give it a more thorough trial another year, and I hope that each of you will lend your aid to this investigation.

### A NEW METHOD OF TREATING THE BROAD LIGAMENT STUMPS IN VAGINAL HYSTERECTOMY.

E. C. DUDLEY, A.M., M.D.

CHICAGO.

In the operation of vaginal hysterectomy the broad ligament stumps are usually treated in one of two ways:

1. They may be ligatured, cut short and returned to the abdominal cavity and the vaginal wound closed, according to the nature of the case, with or without drainage. The objections to this method are apparent; they are: first, the dangers which always arise from the intraperitoneal ligature of a mass which may slough or at least become infected; second, the stumps having been returned to the peritoneum, the broad ligaments can not perform their functions of holding up the pelvic floor, especially holding up the rectum, vagina and bladder. In consequence, these viscera are apt to descend with resultant cystocele, rectocele and enterocele vaginalis.

2. In order to avoid such evil effects, it has been customary to draw the stumps down into the vagina and fasten them there with the same sutures which are used to close the vaginal wound. This makes the operation extraperitoneal and enables the ligaments to perform their functions of holding up the rectum, vagina and bladder.

In some cases the ligaments are so short and rigid that they can not be drawn into the vagina and therefore must be returned to the abdominal cavity. Usually, however, it is quite possible to make the operation extraperitoneal by fastening the stumps below the level of the vaginal wound. The ligatures on the stumps are usually applied *en masse* around the entire ligament in such a way that the ligatured portion will slough. It is better to apply the ligatures so that no sloughing will occur,

that is, to let the ligatures include only that portion of the ligament through which the arteries pass.

#### OPERATION PROPOSED.

The accompanying plate shows a very practical method of treating the ligatured ends of the broad ligaments

wound between the vaginal and peritoneal sides of it. The explanation of the procedure is as follows:

*Fig. A.* The ligaments, having been ligatured *en masse* in such a manner as to avoid sloughing of the ligatured stumps, are drawn down into the vagina by

in such a manner as to avoid sloughing of the ligatured stumps and to fix them in the vaginal wound. The method here illustrated is only applicable to those cases in which the ligaments are sufficiently long to permit either end-to-end approximation or the folding of one on the other and the fixation of them in the vaginal

means of pressure forceps. The anterior and posterior peritoneal margins of the vaginal wound are being whipped together by a continuous catgut suture. At either end of the line of union this continuous suture secures the broad ligaments so that they can not slip back into the pelvic cavity. Only one ligature is here

shown on each broad ligament. In the majority of cases more than one ligature may be required.

*Fig. B.* The anterior and posterior peritoneal margins having been united as shown in Fig. A, the broad ligaments are brought together by end-to-end approximation and united by a continuous catgut suture. The united ends of the broad ligaments are now in contact with and in front of the united peritoneal margins, Fig. A.

*Fig. C.* The anterior and posterior margins of the peritoneal wound have been united and the broad ligaments have been approximated, end to end, by continuous sutures as already shown in Figs. A and B. The anterior and posterior margins of the vaginal mucosa are being united by a continuous catgut suture, making a line of union from side to side. This suture completes the operation.

*Fig. D.* In some cases the broad ligaments are so long that instead of uniting them end to end they may be folded one upon the other and so fastened together. The anterior and posterior peritoneal margins have been united in precisely the same manner as shown in Fig. A.

*Fig. E.* The anterior and posterior peritoneal margins of the vaginal wound have been united by a transverse line of union as shown in A and D. The ends of the broad ligaments have been folded on themselves and are being united by a continuous catgut suture along their lower border. A similar suture should be introduced along the upper border. The ligaments having been thus united are to be covered by the upper and lower margins of the mucosa as shown in Fig. C.

The method of fixing the ends of the broad ligaments between the peritoneal and vaginal sides of the wound will be found to have great value, when practical, for the ligaments so fixed can then perform the very important function of holding the pelvic viscera high up in the pelvis and of preventing the unfortunate prolapse of the pelvic floor (rectum, vagina and bladder), a not uncommon and most unfortunate result of hysterectomy when performed by the older methods.

In vaginal hysterectomy for carcinoma and metritis the broad ligaments will frequently be sufficiently long to permit end-to-end approximation, but they will not in most cases, permit the overlapping as illustrated in Figs. D and E. This method of overlapping the ligaments, however, will always be possible in the operation of vaginal hysterectomy when performed for complete procidentia uteri and is strongly urged in that class of cases.

When the ligaments are not sufficiently long for end-to-end approximation, they may be fixed in the vagina in the ordinary manner, or if not sufficiently long for this, may have to be returned to the pelvic cavity.

Observe in Figs. E and D the isolated ligature of the arteries. This form of ligature will usually be quite practical except for very short and very large ligaments, and when practical, should always be employed. It insures normal circulation in the stumps and is a safeguard against sloughing.

In hysterectomy for carcinoma it is desirable to remove as much as possible of the broad ligaments; hence this operation will be found more especially applicable for the non-malignant cases.

**Test for Dog Sausages.**—It has been suggested to use the blood serum for examining meat in sausages. It is possible by this test to establish the absence or presence of meat from horses, dogs, etc.—*St. Louis Courier of Medicine.*

## THE PHYSICIAN AS A SOCIAL ECONOMIC FACTOR.\*

EDGAR J. SPRATLING, B.S., M.D.

FORSYTH, GA.

In the long-forgotten ages, while men yet lived in caves, the figure that stood out in boldest relief was the medicine man. When society began slowly and timidly to organize itself into a body politic, the chipped flint doing duty as both tool and weapon, the grain about which it crystallized was the ever present medicine-man-priest. To him came his tribe, singly and collectively, asking enlightenment and guidance. His war chief, however brave, however fierce, was only tribal warrior leader, he himself being the real ruler, holding the scepter of life and death over his people. His remedies were few and therapeutically worthless, but his dogmas were all powerful. This picture is faithfully reflected among all primitive peoples even unto this day.

As culture made progress slowly, very slowly at first, but gaining rapidity with the passing of the centuries, the priest-physician was found ever in the forefront, grasping every idea and using each thought put forth by members of any other calling. The lowliest peasant and the veriest tyrant sought the opinions and advice of the astute jugglers in human frailties.

What was true as to influence wielded by the medicine man of the ages past ought to be and will be many times manifold for the enlightened medical man of to-day. Surely if any profession has the right to be proud of its achievements the great family of physicians stand possessed of that honor. See what has been done in lengthening life: From 1890 to 1900 four years have been added to the average longevity of those within the statistical area. It is our first and very pleasant duty to lengthen life, and who can gainsay our success? Is it fair to other professions that we be compared to them? If so, have the lawyers decreased crime or the preachers lessened infidelity? Only in the fields of applied science and the mechanical arts do we find any approach to the record made in medicine.

Twenty years ago tuberculosis was a mystery—deadly as the embrace of the boa—fatal as the sting of the asp—but to-day the great medical laboratories, the doctors' manual training schools, have laid bare its erstwhile mysteries and are rapidly loosening its deadly grasp and plucking its fatal fangs.

Twenty years ago the paranoiac murderer hanged beside the wilful assassin, but to-day the keen-thinking equity-loving physician guides court and jury into the path of actual justice.

Gentlemen, have we done and are we doing our best here? Are we not yet prone to sit in the galleries, silent and helpless, while we are needed in the arenas? We owe the public the benefit of our learning and skill, whether dealing with the criminal, the lunatic, the inebriate or the physically unsound. The fulfillment of this duty will lead to the broadening and deepening of our influence. Let us wake up here and do our fuller duty, gain the greater influence and accomplish the most good.

Twenty years ago men about to enter new business relations did not first obtain their physician's opinion, but they are doing it now among the most intelligent classes, and within a few years the physician's permission will be a *sine qua non* among men about to make radical changes in life, as well as in the choice of callings. The writer can recall numerous interviews like these:

\* Read before the Medical Association of Georgia at its Fifty-third Annual Meeting, Savannah, April, 1902.

"Doctor, I'm about to go into cotton manufacturing. what do you think of it?" "Your lungs are not suited; stick to your farm." "See what you think about my going on the road." "Your stomach will not stand the irregularities." "What do you think my boy should be?" "A mechanic." "Do you think daughter should marry?" "Yes."

Brothers, there is where our power lies; why the future will find us such potent social economic factors—the real arbiters of the great body politic of society. And think of the social power we even now wield. Neither the preacher nor the prize fighter, neither the school girl nor her grandfather, neither the college boy nor his mother, neither the banker nor the gambler, neither the lawyer nor the laborer, the soldier or the sailor can boast of freedom from the doctor's dictum. The army and navy of every civilized country are dependent for their efficiency and perpetuity upon their surgeons' examinations. No immigrant may enter this broad, fertile, sunlit land of ours till the stamp of medical approval rests upon him.

We usher, with gentlest hand and warmest heart, our fellow man into this joyous life, and we lead him tenderly, affectionately, regretfully down the valley of the shadow of death; the first to greet and the last to take leave. And while walking beside him from cradle to grave, we warn him of, and lead him by, the pitfalls of disease and suffering, mental and physical.

This we are to do, not only for the individual, but for the public. The writer expects to see the day when the laws of the states shall provide that one chair in every council, commission and legislative body be filled by a medical man. The people will demand this and the law will give it; we have only to stay awake and be aggressive.

The architect of to-day does not plan a building without its sanitary arrangements being approved by medical science. Does the great steamship, throbbing with life and energy, fearlessly riding the wave, outliving the gale, dare to enter or leave port without having its bill of health viséed by the medical man? The immense life insurance companies, the most successful corporations the commercial world has ever seen, are entirely dependent for their very existence upon the diagnostic and prognostic skill of their medical examiners.

Did you ever feel totally unworthy of the power that you wield? No? Then you have never had to sit in the sacred privacy of your office and tell a well-beloved friend, "Your business days are over, you are far gone in diabetes;" or to another, "Steps in your family's behalf must be taken for you are parietic." Those things make evil days for the tender-hearted doctor; but, brother physicians, when these evils come, think neither of friendship nor of friend, but remember only what is best for those to be left behind, the widow and babes, the relations and last but not least, the public. Harden your hearts unto all save duty.

A thousand years ago the leper and him who was stricken by a plague were shunned of man and beast, outcasted, stoned. A hundred years ago the insane rattled their chains in noisome cells, with vermin for sole companionship. (Blessed be the memory of Dorothea Dix.) Our fathers saw hospital gangrene work its loathsome will undisturbed. We ourselves have seen diphtheria kill in its own peculiarly horrible way while we stood helpless by. In those days, too, our power and influence were less than to-day, when almost every disease has been made to come forth and stand in the brilliant sunlight of scientific research. And as we become more and more the master of disease, we stand nearer

and nearer to the mastery of the patient and through him the family and society at large.

The true physician is ever a man of the greatest influence. His education, training, ways of thinking, broad views, non-sectarian and non-partisan feeling make him a marked man in his community. He is a veritable Abou Ben Adhem: that sweet dream of peace and its awakening are his. He loves his fellow man regardless of color, creed, kith or kin. He is in turn beloved by every one; even the mothers in Israel drop their knitting to smile on him as he passes. And parents lead their children to him to have their futures forecasted, to have them gauged and placed in life's line of battle.

And here, gentlemen, our greatest greatness in the near future will lie. Not in dictating business ventures for the grownup people, but in strengthening and shaping the body and mind of the baby in the cradle, the boy in school, the girl in college and both entering life's work. It is ours to read the physical index and decide how far the body may be depended upon with and without our help. And ours it also is to note the mental gauge and determine its strength and weakness, its shadows and sunbeams, its stability and variability and the directions of its roving, and finally to guide it into paths whose stepping stones across life's quagmires are best suited to its stride.

Could we ask for firmer standing ground or a longer lever with which to move the world?

---

**Medical News' Opinion of the Saratoga Meeting.**—This year's meeting was especially noteworthy for the high character and practical value of the scientific contributions to the program. \* \* \* The social features were well calculated to furnish very pleasant relaxation for those in attendance. The number of members registered this year was not as large as for several years past, but the lack in numbers was compensated for by the interest evinced by all. Rarely have Section meetings been so faithfully attended. In a word, this year's meeting of the National Association has proven to be another step forward in scientific work and in professional organization.

**The election of Prof. Frank Billings, M.S., M.D.,** to the presidency of the American Medical Association is significant of the progressive spirit which animates the medical profession. Dr. Billings, well known from his numerous contributions to internal medicine and from his position as professor of medicine and dean of the faculty of Rush Medical College, Chicago, is a representative of the educational product of the middle West, which, during the last two decades, has contributed largely to the list of leaders in the educational and scientific work of the country. There is scarcely an educational institution of prominence in the eastern or western states that has not availed itself of the sterling qualities possessed by these men of the prairie and lake region. The expansiveness and freedom of the great West has communicated somewhat of its comprehensiveness and vigor to men and institutions, and the strenuous life so necessary to the rapid development of vast natural resources, along absolutely new lines and on a scale never before attempted, is now producing results in fields of endeavor which lie outside the domain of commerce, but in which the same breadth of mind, the same boldness and freedom in action are essential. In selecting Dr. Billings for its president the American Medical Association is but following the lead of many American colleges in giving practical recognition to exemplars of typical Americanism as applied to professional and educational matters. The address delivered by Dr. Billings at the Saratoga meeting, and published in this issue, is indicative of the mental grasp which has placed Dr. Billings in the twenty-one years of his professional career in the front rank of practitioners in the nation, and finally in the distinguished position to which he has now been elected.—*American Medicine*.

## THE HOUSE OF DELEGATES.

Without detracting from the merits of other medical bodies in this or other countries, or from other divisions of the Association under the present or former plan of organization, the House of Delegates, if it fulfills the high purposes for which it was created, is destined to become one of the most useful and potent factors which has ever been formed for uniting and elevating the medical profession. In one sense it is only the agent, mouth-piece or executive committee of the Association, and in another is the creature of the state, and ultimately of the county societies, but there is still another in which it is an independent body, cut off from all political entanglements and alliances, and free to determine all questions coming before it with an eye single to the good of the whole profession. And this spirit and purpose was plainly manifest at the Saratoga meeting. While there was evident at the outset, as might have been and was expected by those most directly responsible, some of the crudeness and friction incident to the operation of all new machinery, this soon cleared away, and the whole time appeared to be utilized by the ninety-six delegates composing the House in an emulation "as to who could best work and best agree." That the importance of its work was very generally appreciated in advance was shown by the fact that the various state societies and sections chose their delegates from among their best members, and that such men as Welch, Osler, Reed, Vaughan and others of equal or scarcely less distinction, chosen as delegates, gave up important scientific work in the sections, for which they had made laborious preparation, in order to devote their entire time to delegate duties. It was no slight honor to serve in the combined capacity of a United States medical Senator and Representative of a great state of this Union, or of an equally great scientific section, and a large majority of the delegates evidently appreciated and were equal to the honor. With such a personnel and moved by such purposes, it goes without saying that the best thought of such a body will be given to the proper fostering of the scientific spirit, not only of the Association as an annual gathering, which is bound to follow, but, what is infinitely more important, to creating, arousing or encouraging, as conditions may require, and through such instrumentalities as may be developed, the same spirit in each of its affiliated state and county societies, and ultimately in each physician embraced within any of these jurisdictions, which means the entire profession.

Among the subordinate but by no means unimportant duties imposed upon this body is the selection of all the officers of the Association. Ineligible for any official preferment themselves by provision of the constitution, and all forms of candidacy and electioneering by any member or his friends having been properly placed under the ban, delegates will have time and opportunity to fairly and deliberately select the officers from the highest and most efficient class of members, and thus indirectly stimulate all who are ambitious for preferment, and who might have been led to hope for it in the past through other methods, strive to make and keep for themselves a position in this class. In order that the best men in the profession may be induced to serve as delegates it was determined that the House shall meet one day in advance of the General Meeting in the future, that its work may be mapped out and gotten into the hands of the committees for such digestion and perfection as will permit it to be finished with the deliberation its importance demands, and yet at such hours as will interfere as little as possible with section work. These and other similar problems are important, but are matters of detail which may be safely entrusted to time and the good judgment of the profession; but the very existence of the House of Delegates as an accomplished fact—evidently in the minds of the Association in a nebular way, but certainly the fruition of the labor and hope of thoughtful members for a generation—marks an epoch, and we believe an epoch for great and continuous good to the medical profession and people of these United States.

## THE TETANUS EPIDEMIC.

We shall have this year our usual tetanus epidemic. Most of the cases will develop from ten to fourteen days after the Fourth of July. Commonly it will be found that a burn, inflicted by fireworks, often not of a serious character, or some slight wound from a toy pistol, preceded the development of the disease. The noisy annoyance and the yearly crop of deaths from tetanus are a high price to pay for the fostering of patriotism that is supposed to go with the present form of celebration of the glorious Fourth, but it seems idle to hope that the annual nuisance will be done away with—in our generation at least. So long as the horse remains with us, then, to discharge large numbers of tetanus bacilli on our city streets where tardy street cleaning permits the excreta to dry and so constitute an important part of street dust and dirt, the conditions necessary for the development of tetanus will obtain and the disease will continue to be a feature of city life at this time of the year.

The first question is that of prophylaxis. Tetanus develops especially after wounds deep in the tissues, or those that are seared by heat; in a word, after wounds in which the bacillus is protected from contact with the oxygen of the air in the presence of which the anaërobic germ will not grow. When wounds present themselves, therefore, which have been exposed to contamination

with street dirt, or with barnyard refuse, the ideal surgical treatment is not to encourage rapid superficial healing, but to be sure that the wound heals from the bottom and that any foreign material present is thrown off in the process. For this purpose it may be necessary to open the wound more freely and to permit some free bleeding to take place. With regard to superficial burns, it is especially important to remove all seared tissues and, as far as possible, to permit healing to begin only from freshly bleeding surfaces.

The tetanus bacillus does not produce pus. In fact, as a rule, it gives but very slight and sometimes no local reaction in the tissues where it is buried. The toxins of the bacillus, however, find their way to the cells of the central nervous system and uniting with them produce very serious changes, soon noticed in their effect upon the muscles, whose nerve supply is regulated by the affected cells. The first symptoms of tetanus, then, as seen clinically, are not the beginning of the disease, but, as has been well said, the preliminary signs of death from tetanus because of irremediable damage to the central nervous system. This emphasizes the necessity for thorough opening of suspected wounds at the time of primary treatment, even though it may involve additional pain and some risk of scarring. Cauterization or the use of strong antiseptics in suspected wounds seems eminently inadvisable, since these measures leave a set of dead cells *in situ* that may serve as a protective barrier for the anaërobic bacilli against the bactericidal oxygen of the air.

The use of antitetanic serum for prophylactic purposes before the development of tetanus symptoms has been suggested, but at best is of only temporary benefit. The serum is not a germicide, but serves only to neutralize the toxins of the tetanus bacilli. Whatever tetanus toxins are in the circulation at the time of the injection will be rendered innocuous, but those due to the further growth of the bacilli will be very little hampered in their action. Subcutaneous injections of the serum after the symptoms of tetanus have declared themselves, are of very slight avail. At this time the toxins of tetanus have formed inalterable compounds with certain of the components of the nerve cells, causing irreparable injury. In conjunction with other and more effective treatment, subcutaneous injections of tetanus serum may be of service because they neutralize the toxins constantly given off from the focus of tetanus bacilli present in the tissues, and so serve as a defense against further toxic invasion until nature's protective powers are sufficiently aroused to render their aid unnecessary.

Experience has shown that the bringing of the anti-tetanus serum directly in contact with the nerve tissues constitutes the only hopeful method of treatment. This may be accomplished either by subarachnoidal or subdural injections. Subarachnoidal injections are made through a lumbar puncture. Dr. Jacob<sup>1</sup> of Berlin, one of Professor Leyden's assistants, has reported six cures

out of nine cases treated by this method. Three of the cases suffered from tetanus of the severest type. Two of the patients had temperature of over 40 C. (104 F.) when the injections were given, and there are good authorities who hold that when tetanus patients develop a temperature above 39.5 C. (about 103 F.), the case will always terminate fatally. A third case was one of tetanus puerperalis. The death rate from this form of the disease is said to be, practically, 100 per cent., and besides the affection was of severe type and had a very short incubation period, making the prognosis, if possible, still more hopeless.

It would seem, then, that this method of treating tetanus should be given a trial, especially in cases where the circumstances are not such as to encourage the subdural injection of the antitetanic serum. By the subdural method the serum is introduced beneath the membranes of the brain after previous trephining. The results thus far obtained by this method have been very promising. It is, of course, a very serious operation, but the fatality from tetanus is so large as amply to justify the procedure. It is not invariably successful because if the tetanus toxins have affected very many nerve cells recovery can not be looked for. The method has proved life-saving, however, in many apparently hopeless cases, and so far has not seemed to add any considerable risk to those of the tetanus itself.

#### SOME REFLECTIONS OF HEMIPLEGIA.

The return of a varying degree of motor power in members paralyzed as a result of hemorrhage into the brain, occlusion of a cerebral vessel and secondary softening and other cerebral lesions has been attributed in part to the escape from destruction of certain nerve fibers, with their release from pressure and from the effects of the inflammatory process and in part to the assumption by the corresponding centers in the opposite hemisphere of the functions subserved by those of the injured side. The heightening of the reflexes and the development of contractures have in their turn been attributed to the removal of the inhibitory action of the higher over the lower centers through interruption of their channels of communication, and also to the irritation arising out of the sclerosis of the motor tracts.

For some time evidence has been accumulating that tends to throw doubt upon these explanations for well-recognized phenomena. It has been shown that, in addition to the motor fibers that pass directly from the cerebral cortex to the pyramidal tracts, through the pons and medulla to the spinal cord, there are others that are diverted first to the optic thalamus and the quadrigeminate bodies, and that it is largely through these that restoration of motor function and exaggeration of reflexes and contractures take place in the sequence of hemiplegia of cerebral origin. This aspect of the subject has been recently discussed at some length by Dr. Max Rothmann,<sup>1</sup> who, as a result of his studies,

1. Leyden Festschrift, vol. II, 1902.

1. Berliner klinische Wochenschrift, April 28, May 5, 1902.

concludes that hemiplegia in man, and its consequences, are not caused by destruction of the pyramidal tracts alone, but that, in addition, interruption of other cerebrospinal paths must have taken place. In case of excision of the portion of the cerebral cortex controlling the muscular activity of the extremities, or in case of total destruction of the posterior limb of the internal capsule, the resulting hemiplegia is due to complete loss of conduction of motor impulses from the cortex. Under such conditions, the paths between the quadrigeminate bodies and the spinal cord, and their connections with the optic thalamus, are at first unable properly to maintain the motor functions, and transmit to the spinal cord only impulses for maintaining the tendon-reflexes. The partial restoration of active movements that sets in in the course of several weeks is the result of the gradually developing independent motor function of the optic thalamus, or of the quadrigeminate centers, and has no connection with the reestablishment of the pyramidal tract or the vicarious action of the cerebral cortex of the opposite hemisphere.

The fact that restoration of only certain groups of muscles takes place in human beings, in contradistinction from apes, with persistent paralysis of the antagonists, and that contractures develop in consequence, is due to peculiarities in innervation of the arms and legs arising out of the assumption of the erect attitude by the former. Inasmuch as in case of restoration of movement, the condition is not one of reestablishment of previously injured paths, but of an education of new paths, the institution of exercises of the paralyzed parts, and especially of the muscles that would otherwise remain paralyzed, is indicated as early as possible after development of the paralysis. Such treatment by exercises will in some cases be advantageously supplemented by tendon transplantation of the paralyzed muscles.

#### VARIETIES OF ENDOCARDITIS.

Endocarditis, like the inflammatory process in general, may result from a variety of irritating factors, mostly bacterial in character. In consequence of the reaction between the morbid agents and the invaded tissues, there may develop irregular roughening or elevation of the endocardial surface, or polypoid or villous formations, or ulcerations, or even suppuration, representing the different pathologic types of endocarditis, with corresponding clinical variations. The several lesions would seem to be the expression of modifications in the intensity of the morbid process rather than of any specific pathogenic activity on the part of the causative micro-organisms. Some observations in support of this view were communicated at a recent meeting of the Royal Medical and Chirurgical Society by Drs. F. J. Poynton and Alexander Paine,<sup>1</sup> who had previously isolated from the blood, during life, in cases of acute rheumatism and from the lesions after death a dip-

lococcus susceptible of culture on artificial media and which, when injected into lower animals, gave rise to symptoms and lesions of the same disease, with the presence of the identical micrococcus in the blood and tissues. In the course of further investigations they were able to demonstrate a close clinical relationship in some cases between rheumatism and so-called malignant endocarditis. This result was reached from clinical observation, from a study of the morbid anatomy and from bacteriologic and experimental investigations.

With the diplococcus isolated from seven cases of malignant endocarditis it was possible to develop the same disease in lower animals. A like result could be brought about with the diplococcus of rheumatism, and, conversely, it was possible to produce rheumatism with the micro-organism that caused malignant endocarditis. The diplococcus found in the two conditions exhibited slight but not essential differences, those associated with malignant endocarditis being smaller and more rapid in growth. Both possessed acid-producing properties, which it was thought might play some part in the rheumatic process. A distinction was found to exist between the vegetations upon the cardiac valves in cases of rheumatic endocarditis and in those of cases of malignant endocarditis, numerous diplococci being present in the necrotic tissue in the latter, while there was none in the former. Between these extremes there were all gradations. The tendency for malignant endocarditis to occur in damaged valves was thought to be due to a lack of resistance in these structures.

The foregoing observations go to show that so-called malignant endocarditis represents an intense or virulent inflammation of the lining membrane of the heart, differing only in degree from other forms of the same morbid process, and also that the same lesions may be induced by the same micro-organism as appears to give rise to acute rheumatism. There is, further, not wanting collateral evidence that the disorder may be caused also by other micro-organisms.

#### THE INDEX OF CURRENT MEDICAL LITERATURE.

The readers of THE JOURNAL will note that the Index of Current Medical Literature in this, the concluding number of the volume, contains not only the American, but also the European titles. Heretofore this has been—since the discontinuance of the publication of the Index Medicus—the most complete index of papers in the medical publications of this country. With the present additions, which nearly double its size, it affords an index also of most of the leading foreign journals, sufficient, it is thought, for many purposes, for the consultants of foreign medical literature. With the abstracts given, THE JOURNAL reader should be kept well posted as to what is being done in medical science abroad. There is a utility in this which we believe will be appreciated by American workers, as the *Bibliographia Medica*, the successor to the *Index Medicus*, is not readily available to many in this country and its continuance is, moreover, an uncertainty. Unless we have evidence which has

1. Lancet, April 12, 1902, p. 1036.

been wanting heretofore that the efforts of THE JOURNAL in this direction are not appreciated by the profession. its index of current literature will continue to appear with each volume and such features as may seem to increase its value will be added from time to time. The publication of the index in this issue encroaches on the usual number of reading pages of THE JOURNAL.

## Medical News.

### MASSACHUSETTS.

**Medical College Site Secured.**—By the purchase of three parcels of land, June 13, Harvard University Medical School has practically completed the acquisition of the property whereon its new buildings will be erected.

**Personal.**—Dr. Lewis M. Palmer, South Framingham, has been appointed medical examiner for the Eighth Middlesex district, vice Dr. Zabdeal B. Adams, deceased.—Dr. J. Addison Sawyer, Haverhill, has moved to Bradford.—Dr. James C. White delivered his last lecture before the students of Harvard Medical School, May 28. He has been a member of the faculty for 44 years.

**The Hospital's Work.**—The eighty-eighth annual report of the Massachusetts General Hospital shows that the average weekly cost per patient was \$15.17, as against \$15.05 in 1900. In the out-patient department the number of new cases treated was 27,667 in 1901, 31,043 in 1900. The whole number of patients treated last year in the hospital was 5353, as against 4883 in 1900; the number of free patients was 3527, against 3136 in 1900, and the number of patients paying in whole or in part was 1836. The number of patients treated in the accident room was 5777, as compared with 5262 in the previous year.

### MICHIGAN.

**Personal.**—Dr. C. M. Ryno, Kaiaamazoo, sailed, June 18, for Antwerp. He will spend about six months in study abroad.—Drs. W. S. Brownell and Nicholas M. Spranger, Detroit, have been appointed city physicians.

**Mercy Hospital.**—Mr. Charles H. Hackley, Muskegon, has given to that city a site on which he will erect a hospital, the entire expense being about \$75,000. He has also promised to endow the hospital, when completed, with \$50,000.

**Grand Rapids Medical College** held its sixth annual commencement exercises, June 2, graduating a class of 19. Dr. Clarence H. White delivered the address; Dr. William Fuller, dean of the faculty, made his report; Hon. Willis B. Perkins administered the hippocratic oath and Dr. Frank J. Lee presented the diplomas.

**May Michigan Mortality.**—There were 2686 deaths in the state during May, a decrease of 164 from the preceding month, and an increase of 22 over May, 1901. The death-rate was 12.8 per 1000 per annum. There were 465 deaths of infants under 1 year of age; 194 deaths of children aged 1 to 4 inclusive, and 769 deaths of persons aged 65 years and over. Important causes of death were as follows: Tuberculosis, 246; typhoid fever, 34; diphtheria, 31; scarlet fever, 25; measles, 43; whooping cough, 29; pneumonia, 311; diarrhea, children under 2 years, 60; influenza, 27; cancer, 101; accidents and violence, 152.

### NEW YORK.

**Faculty Accretions.**—The faculty of Albany Medical College has appointed Dr. William S. Hailes demonstrator of anatomy, Dr. Christian G. Hacker instructor of materia medica and therapeutics, Dr. H. W. Carey, instructor of histology, and Dr. Peter H. Moak instructor of pathology.

**Personal.**—Dr. John T. Harris has been appointed health physician of Tonawanda.—Dr. Frederick W. Smith has been appointed health officer of Syracuse, vice Dr. Bernard S. Moore, resigned.—Dr. Robert H. Pierson, Syracuse, has passed the examination for the medical corps of the army.—Dr. Henry C. Sutton has been appointed health officer of Rome.—Dr. Alpheus L. Price, Byron, has been commissioned a member of the board of pension examiners, succeeding the late Dr. Morris W. Townsend of Bergen.

**Improved Diet List for State Hospitals.**—An increase in the diet of 23,000 insane persons in the eleven state hospitals has been ordered at an additional expense of about \$50,000. The action follows the recommendation contained in a report

made by a commission composed of the superintendents of the Binghamton, Ogdensburg and Poughkeepsie hospitals. Even with this change the per capita cost by reason of improved administration and closer inspection of the buying and distribution of supplies will be lower than ever.

### New York City.

**Lebanon Hospital,** the Bronx, has received \$60,000 from Mrs. Clara Simon, in memory of her husband, who died three years ago.

**Dr. Sweet's Portrait Presented.**—At a recent meeting of the New York Academy of Medicine, a portrait of Dr. John Appleton Sweet was presented to the Academy.

**For Sick Hebrew Children.**—Contracts have been let for the construction of a large pavilion in the grounds of the Sanitarium for Hebrew Children at Rockaway Park. The pavilion will accommodate 600 mothers and children.

**Dormitory for Sanitarium.**—Henry Siegel has presented \$20,000 to the Stony Wold Sanitarium for a dormitory in memory of two of his trusted employes, who died from tuberculosis, and a memorial tablet will be placed in the dormitory. The gift is conditional on the raising of a sufficient sum to finish the structure.

**Emergency Hospital at Coney Island.**—The reception hospital at Coney Island opened, May 25, for the season. It has accommodation for 20 patients and is conducted as a branch of the King's County Hospital. The hospital is not a fully-equipped general hospital, its character and equipment having been planned for the purpose of giving first-aid only; but dispensary cases of an urgent character are also treated. Those cases requiring major surgery receive first aid at the reception hospital, and are then transferred to the Kings County Hospital.

**Personal.**—Drs. Alexander Hugh Ferguson, Chicago, and Andrew B. Somers, Omaha, were entertained in New York last week by Dr. Thomas H. Manley. On invitation of Dr. Manley, Dr. Ferguson operated on a case of gangrenous femoral hernia, resecting 13 inches of mortified intestine and making an end-to-end anastomosis with the Murphy button.—Dr. Alfred S. Ambler, superintendent of the Brooklyn Hospital, has resigned.—Dr. Seymour Oppenheimer has been appointed laryngologist and otologist to Gouverneur Hospital.—Dr. John T. Sprague, Stapleton, has been appointed sanitary superintendent for the Borough of Richmond, at a salary of \$3500.

**Tablet in Memory of Honored Dead.**—A memorial tablet has been presented to the College of Physicians and Surgeons, Columbia University, by the alumni, in honor of the graduates who died during the Spanish-American war. In presenting the tablet Dr. John G. Curtis, professor of physiology, made a short address, giving an account of the careers of the Columbia men who lost their lives in the war. President Butler responded for the university. The tablet, which is of oxidized bronze with raised letters of bright bronze, is in memory of John Blair Gibbs, assistant surgeon U. S. Navy, killed at Guantanamo; George Washington Lindheim, assistant surgeon, Eighth Regiment, N. G. S. N. Y., who died of typhoid, Sept. 16, 1898, and Harry Augustus Young, Eighth Utah Light Artillery, who was killed at Manila, Feb. 6, 1899.

### Buffalo.

**The Emergency Hospital,** which has always been under the same administration as the Sisters of Charity Hospital, has been reorganized under its own board of managers, and will be independent of the Sisters' hospital, although the Sisters of Charity still supervise both institutions.

**Personal.**—Dr. James S. Porter has succeeded Dr. William B. May as milk inspector and Dr. Edward L. Frost has been appointed inspector of foods and drugs, vice Dr. William H. Heath.—Dr. Herman Mynter and wife have sailed for Europe. After visiting relatives in Copenhagen they will make a tour of the medical centers of Europe.

### PENNSYLVANIA.

**Hospital Saturday and Sunday.**—As a result of the annual collection for the benefit of the hospitals of Pittsburgh and Allegheny, \$5700 was distributed among these institutions.

**Personal.**—Dr. Bert K. Vannaten, Venango, has been appointed assistant surgeon and assigned to the Sixteenth Infantry, N. G. P.—Dr. John M. Duff, Pittsburgh, has been elected a director of the South Side hospital for five years.

**Hospital Sued.**—Dr. Susan J. Tabor, late a member of the staff of the State Hospital for the Insane, Norristown, has sued

that institution for \$11,454.66, salary alleged to be due her. She claims that her appointment was for five years, and that she was discharged without reasonable cause.

**West. Penn. Commencement.**—The sixteenth annual commencement exercises of Western Pennsylvania Medical College, Pittsburg, were held, May 29, when a class of 48, including two women, was graduated. Dr. Samuel C. Milligan delivered the annual address and the degrees were conferred by John A. Brashear, acting chancellor of the university.

#### Philadelphia.

**Hospital Bequest.**—By the will of James H. Grier, War-  
rington township, Presbyterian Hospital receives \$10,000.

**Dr. J. Norman Risley** has been commissioned lieutenant and assistant surgeon, N. G. P., and assigned to the Third Infantry.

**Pennsylvania Hospital Report.**—The one hundred and fifty-first annual report of the managers of this institution shows that 4705 ward and private patients were treated during the year, an increase of 702 over the previous year. The number of patients admitted during 1901-1902 was 360 more than in any year of the hospital's century and a half of existence. The daily average was 251. The number of cases admitted to the receiving ward was 23,142, a daily average of 63. Of these 3435 were sent to wards. This is an increase of 2781 over the preceding year. At the out-patient department 16,388 persons were treated, 1508 more than the year before. The total number of visits to the out-patient department was 58,727, compared with 54,295 a year ago; 39,800 cases were treated in all, or 4285 more than last year. The resident physicians made 83,869 examinations, besides attending 251 ward patients, daily. At one time 301 patients were in the wards, a larger number than ever before, except during the late war. The cost of maintenance increased \$4,506.51 during the year, and reached \$126,020.41. Legacies to the hospital amounted to \$50,747.57 during the year and \$26,930 came in the form of contributions. The sum of \$227,437.43 was expended in maintaining the insane department.

#### TENNESSEE.

**Personal.**—Dr. Larkin Smith, health officer of Nashville, has gone to London, where he will spend several months in study and research.

**Knoxville Medical College** graduated a class of two, May 27. Dr. Henry M. Green delivered the charge to the graduates and Dr. Edward L. Randall presented the diplomas.

**Memphis Hospital Medical College.**—This college graduated a class of 171 at its recent commencement. Hon. Josiah Patterson delivered the address to the graduates, and Dr. Bennett G. Henning conferred the degrees. The new building for the college has been completed in every detail and is now ready for the reception of students. It is provided with five large lecture halls, commodious laboratories, and will comfortably accommodate more than a thousand students.

**Vanderbilt Faculty Changes.**—The medical department of Vanderbilt University, Nashville, announces the following changes: Dr. Richard A. Barr, adjunct to professor of abdominal surgery; Dr. Lucius E. Burch, adjunct to professor of diseases of women; Dr. John T. Altman, professor of obstetrics; Dr. Worcester A. Bryson, adjunct professor of surgery; Dr. A. Bennett Cooke, professor of anatomy; Dr. John A. Gaines, adjunct professor of practice of medicine, and Dr. Owen Wilson, clinical professor of diseases of children.

#### TEXAS.

**Waco Board of Health.**—The new board of health has organized with Dr. Charles T. Young, president, and R. D. Dickey, ex-officio member, secretary.

**San Antonio Hospital Incorporated.**—The Physicians' and Surgeons' Hospital of San Antonio has been incorporated with a capital stock of \$50,000, by Drs. Francis M. Hicks, Frank Paschal, Dabney Berrey, John S. Lankford, William E. Luter, James H. Bindley, Robert E. Moss, Witten B. Russ and others.

**Commencements.**—Dallas Medical College, medical department of Trinity University, graduated a class of ten. Dr. William M. Yates, Cleburne, delivered the faculty address; Rev. R. L. McElree, Alvarado, discussed medical ethics and Rev. L. C. Kirkes presented the diplomas.—The Medical Department of the University of Texas, Galveston, conferred degrees on a class of 16, May 31. Prof. Edward Randall delivered the address of the evening, and President Prather of the University presented the diplomas.

**Dallas Medical College.**—Dallas Medical College, medical department of Trinity University, held its annual stockholders' meeting, May 31. The election resulted as follows: Directors, Drs. John C. Armstrong of Garland, Franklin U. Painter of Pilot Point, Peyton L. Campbell, James E. Wilson and Hugh L. McNew; Dr. Painter was elected president; Dr. McNew dean, and Dr. Wilson secretary. The directors will select a new faculty.

**Harmonization of Dallas Colleges.**—The stockholders of the medical department of the University of Dallas, on May 24, elected the following board of trustees: Drs. Edward H. Cary, Charles M. Rosser, Samuel E. Milliken, Vene P. Armstrong, James M. Inge of Denton, J. H. Florence, E. Dunlap, Alexander M. Elmore, Joe Becton, and Jesse B. Titterington. By unanimous vote it was agreed to effect a consolidation with the Dallas Medical College under the original charter of the University of Dallas, the institution to continue the medical department of the University of Dallas and to be hereafter known as the Dallas University Medical College.

#### VIRGINIA.

**University College of Medicine, Richmond,** graduated a class of 8, May 15. Hon. John Goode delivered the address of the evening.

**Cancer Hospital in Norfolk.**—A hospital for the treatment of cancer and kindred trouble is to be opened shortly in Norfolk under the professional charge of Dr. Patrick H. C. Noble of Richmond.

**Dixie Hospital.**—At a recent meeting of the incorporators of the Dixie Training School for Colored Nurses and the Dixie Hospital, Newport News, it was decided to erect a new hospital building to cost not less than \$25,000.

**Nash Semi-Centenary.**—Dr. Herbert M. Nash, Norfolk, on the occasion of the fiftieth anniversary of entering the practice of medicine in that city, was given a banquet by the physicians of Norfolk and vicinity, at which Dr. Israel Brown presided as toastmaster.

**Medical College of Virginia.**—At the commencement exercises of this college, held May 8, Dr. Christopher Tompkins presided and awarded diplomas to a graduating class of 13. Rev. William E. Evans, D.D., was the orator of the evening, his topic being "The Dynamics of Germs."

**Personal.**—Dr. Joseph I. McCool has been appointed assistant surgeon of the second class, vice Dr. John K. Knorr, resigned, in the National Soldiers' Home, Hampton, Va.—Dr. Harry B. Struble, interne in the hospital, has resigned and gone north.—Dr. A. T. Nelson, Rapidan, has been appointed assistant physician at the Western State Hospital, vice Dr. William H. Yeakley, resigned.—Dr. Moses D. Hoge, Jr., Richmond, has resumed the chair of histology and clinical diagnosis at the University College of Medicine; Dr. H. Stuart MacLean has been elected professor of bacteriology and pathology, and Dr. Alfred L. Gray, professor of physiology.—Dr. John M. Henderson, for several years assistant physician at the Central State Hospital, Petersburg, has resigned and will enter private practice.

#### WISCONSIN.

**Private Hospital.**—Dr. William F. Malone, Milwaukee, has purchased a building which he will fit up and equip as a private hospital.

**Fifty Years in Practice.**—Dr. Thomas P. Russell, Oshkosh, has just passed the fiftieth anniversary of his entry into the ranks of practicing physicians.

**Donation to Hospital.**—Oriden Evanson, a farmer living near La Crosse, has given \$5000 to the Norwegian Lutheran Hospital in that city, to be used in caring for the needy poor.

**New Hospital at Madison.**—A new hospital is to be erected at Madison to cost \$25,000. Of this amount \$10,000 has been donated by citizens and \$15,000 appropriated by the city council.

**Graduation Exercises.**—The Wisconsin College of Physicians and Surgeons, Milwaukee, graduated a class of 19, April 30. Dr. Alfred H. Levings conferred the degrees, and Dr. William F. Becker delivered the doctorate address.—Milwaukee Medical College graduated a large class, April 14. Dr. William H. Earles presented the diplomas and Rev. D. J. O'Hearn delivered an address on "Medical Ethics."

**Personal.**—Dr. John W. Coon, registrar of vital statistics, Milwaukee, has resigned and will spend several months in post-graduate study in the East.—Dr. Leonard E. Spencer, Wausau, has been appointed a member of the State Board of Health,

vice Dr. J. Henry McNeel, Fond-du-lac, term expired.—Dr. Theodore Kech has been made health officer of Baraboo.—Drs. Moses J. White and William F. Beutler, Wauwatosa, will spend the summer in visiting European hospitals for the insane.—Dr. Bertha V. Thomson, Necedah, has been appointed assistant physician at the Northern Hospital for the Insane, Oshkosh.—Dr. Arthur T. Holbrook, Milwaukee, has sailed for Europe.

#### GENERAL.

**Cholera in the Philippines.**—The total number of cases of cholera to June 22 in the Philippines is 8899, of which 1530 were in Manila, 6676 of these died, of which number 1236 were in Manila. Ninety American soldiers have been among the dead.

**Beneficent Sanitation in the Philippines.**—Major-General Lloyd Wheaton, U. S. A., who arrived, June 22, from the islands, having completed three and a half years' hard service there, and who will be retired, July 15, after 41 years' service in the Army, bears testimony to the great saving of life in the islands by the measures taken by the Army. The stamping out of smallpox by isolation and vaccination, the warding off of bubonic plague by inoculation and quarantine and the limiting of the cholera epidemic by the stringent measures taken have saved hundreds of thousands of lives. The loss of life by war, he says, seems infinitesimal in comparison.

#### Smallpox.

**Colorado:** In May 130 cases of smallpox were reported, a decrease of 6 cases compared with the preceding month. The deaths from the disease numbered 13.

**Illinois:** Seven new cases of smallpox were discovered in Chicago during the week, and for the first time in some months they were all of white persons. None, of course, had been vaccinated, although one, a woman, was 75 years old. Two of these new cases were pupils attending the McLaren School. Investigation shows that these children were in attendance on transfer slips of vaccination furnished from other schools. Personal examination proves that the attempted vaccinations in 1899 and 1900 were failures, as there is not the slightest trace of the characteristic vaccination scar. Yet the vaccination certificates were issued by physicians as "successful vaccinations," upon which the children had been admitted to school attendance. No blame can possibly be attached to the principal nor to any of the teachers of the school. But it is a serious question what should be done with physicians who certify to successful vaccination without ever taking the trouble to examine the arm after the operation to determine success or failure.

**Maryland:** The secretary of the State Board of Health reports that from May 11 to June 16 there were 5 cases in Dorchester County, 1 in Caroline County, 1 in Somerset, 5 in Washington County, and 1 in Baltimore County. One death occurred in Washington County. The outbreak in Somerset and Caroline counties was said to be checked, which left only Dorchester, Baltimore and Washington counties in the list of affected counties.

**Michigan:** Smallpox was reported to the State Board of Health from 154 places, 82 places less than in the preceding month.

#### FOREIGN.

**Statistics of Plague in India.**—A government statement regarding the condition of India in respect to the plague, says the Chicago *Inter-Ocean*, from its first outbreak in Bombay in September, 1896, to March, 1902, shows a total of reported deaths from the disease during that period of 536,600 in the Bombay Presidency and 315,400 in other parts of India, or a total of 852,000 for the whole of British India and the native states. Making allowance for untraced and unreported deaths, it is calculated that a million died during the period mentioned. During the first three months of 1902, the deaths reported in the Bombay presidency were 62,667, compared with 17,806 in the corresponding period of 1901. Other parts of India show a corresponding increase, especially in the Punjab, where the deaths in 1900 were 515; in 1901, 15,245, while in the first month of 1902 the figures have risen enormously, the deaths reported in March alone numbering 42,788.

#### LONDON LETTER.

##### The Smallpox Epidemic.

The epidemic continues steadily to decline. There are 1162 cases in hospital, against 1360, 1344 and 1274 in the preceding weeks; 188 new cases were admitted during the week against 233, 307 and 251 in the three preceding weeks.

##### South African Civil Surgeons' Dinner.

About 100 of the civil surgeons who had served in the South African war held a dinner at the Hotel Cecil, with Sir Fred-

erick Treves in the chair. In proposing the toast of "The Imperial Forces" Dr. Conan Doyle, the celebrated novelist, who has served at the front as a civil surgeon, said that the Army Medical Department had been starved in time of peace, but when it suddenly found itself face to face with war and was in need of help, hundreds of civil surgeons sprang to the front. Surgeon-General Taylor, director-general of the Army Medical Department, in responding to the toast, said that the help derived from the volunteers was the most wonderful thing in the history of the war. He looked on the union of the civil and military portions of the medical profession as one of the best auguries of good for the Army Medical Department.

#### Festival Dinner of the Medical Graduates' College and Polyclinic.

The annual festival dinner was held in the Criterion restaurant, with the Right Hon. H. H. Asquith, K.C., M.P., in the chair. The guests, who numbered about 300, were received by the president, Sir W. Broadbent. The chairman in proposing the toast of the "The London Polyclinic" pointed out that the institution had a double object: It was charitable in the best sense of the word, and without coming into competition with the hospitals it provided the best medical advice for patients who could not pay a consultation fee. It thus filled a gap in the machinery of philanthropy. During 1901 nearly 1200 patients received advice. There was another side still more important: it provided the means for qualified physicians continuing their medical education. The Polyclinic was still in an embryonic condition, and was in want of funds. There were nearly 900 members and the classes were well attended. Sir W. Broadbent, in responding to the toast, said that the medical student, after passing his examination and qualifying for practice, was faced by problems in diagnosis and treatment for which his preparation for examination helped him only in small degree. The object of the Polyclinic was to afford these medical men the opportunities for what might be called secondary education. A collection was made after the dinner and \$2500 was subscribed in aid of the Polyclinic.

#### The Plague.

The returns for the week ending May 17 show that in India there is a marked decrease in the number of deaths from plague. They were 7008 against 11,612 in the preceding week. The chief fall has been in the Punjab, where nearly two-thirds of the total deaths and cases in India have occurred. In Bombay city the deaths from plague during the week ending May 17 were 300, against 391 in the corresponding week of 1901. In the other Bombay districts there were 429 deaths against 583 in the previous week; in Calcutta 209 against 280; in Bengal 136 against 237; in the northwest provinces and Oudh 266 against 280; in the Punjab 5453 against 9122. In Egypt, during the week ending May 25, 28 fresh cases of plague and 16 deaths occurred. All the new admissions and deaths occurred in natives. The number of cases under treatment on May 25 was 31, the same as last week.

## Correspondence.

#### A Unique Case.

PITTSBURG, PA., June 14, 1902.

*To the Editor:*—I have thought the following case of sufficient interest to report. My friend, Dr. R. J. Phillips of this city, attended a woman in her second confinement yesterday. There was a twin birth (boys), both children well developed except that each one had a harelip and one has five fingers on one hand and only partial development of the thumb.

Yours, etc.,

JOHN MILTON DUFF.

#### Corrections in the History of the Sections.

Recent letters report two corrections in the "History of the Sections of the American Medical Association," which appeared in THE JOURNAL of June 7. The chairman of the Section on Dermatology and Syphilography for 1894 is credited to Colorado, when California was meant. This was a typographical error. The names of chairman and secretary of the Section on Laryngology in 1898 were transposed. The names as given in the history were quoted from the official minutes printed of that Section. The printed minutes were therefore at fault.

## Societies.

### COMING MEETINGS.

Medical Association of Nevada, Virginia City, July 7, 1902.  
American Ophthalmological Society, New London, Conn., July 16, 1902.

**Platte County (Mo.) Medical Society.**—In honor of the semi-centennial of practice of its president, Dr. E. McD. Coffey, the annual meeting of this Society on July 12 will be held at Platte City.

**Physicians' Club of Chicago.**—The annual meeting of the club took place May 26. The following officers were elected: Secretary, Dr. L. Harrison Mettler; board of directors, Drs. Alfred C. Cotton, president; Joseph Zeisler, treasurer; G. Frank Lydston, Walter S. Christopher, J. Clarence Webster and John M. Dodson.

**American Roentgen Ray Society.**—The next meeting of this Society will be held in Chicago, December 10 and 11. The local committee of arrangements is composed of Drs. Ralph R. Campbell, John B. Murphy, Louis E. Schmidt, Malcolm L. Harris, William L. Baum, Henry G. Anthony and William Allen Pusey.

### AMERICAN GYNECOLOGICAL SOCIETY.

*Twenty-seventh Annual Meeting, held at Atlantic City, N. J., May 27-29, 1902.*

*(Concluded from p. 1668.)*

President, Seth C. Gordon, M.D., Portland, Maine, in the Chair.

#### The Relative Advantages of the Complete and Partial Hysterectomy.

DR. E. E. MONTGOMERY of Philadelphia spoke of the difficulty the present student had in appreciating the slow process of development in the operation of hysterectomy, whether partial or complete. The procedure as perfected by Goffe and Baer marked an epoch in the progress of partial hysterectomy. Without intending to disparage the work of these gentlemen, he pointed out that the operation in many of its details had been done before these gentlemen had essayed their first operation; that Charles T. Parkes of Chicago was probably the first to resort to the supravaginal amputation of the body of the uterus, with the return of the stump to the abdomen after ligation of the uterine arteries. In the complete operation he advocated the Doyen procedure as the one most desirable. He preferred the panhysterectomy to the partial operation, for the reasons that it was more expeditious, it rendered hemostasis more secure, it decreased the danger from sepsis in removing any dead space in which fluids could accumulate and become infected. The cervix retained by the former method is not always free from danger from subsequent degenerative processes.

A paper by Dr. George H. Noble, Atlanta, Ga., on "A New Operation for Complete Laceration of the Perineum," will appear in full, illustrated, in THE JOURNAL.

#### Treatment of Placenta Previa—Cesarean Section Not Justifiable.

DR. ROBERT A. MURRAY, New York, in a contribution on this subject, referred to a paper read last year before the American Association of Obstetricians and Gynecologists, by Dr. Zinke, Cincinnati, on this subject, also to a discussion which it elicited. In Zinke's paper a strong plea was made for the treatment of placenta previa by Cesarean section. Dr. Murray protested against such a radical measure, and believes that by proper treatment one can avoid the performance of this operation in many instances. In fact, only a very small minority of cases of placenta previa should, in his opinion, be treated by Cesarean section.

DR. J. WHITTREDGE WILLIAMS, Baltimore, questioned the propriety of Cesarean section for placenta previa, and said the operation was done too frequently. Recent statistics as to the great safety attending this operation were liable to do almost as much harm as good. If the society did not take a decided

position in regard to Cesarean section in cases of placenta previa, he feared that this operation might be practiced as frequently and indiscriminately as was oöphorectomy. In his opinion there was a small field for Cesarean section in placenta previa.

DR. EDWIN B. CRAGIN, New York, said the conditions were so numerous which would justify Cesarean section in placenta previa that they were seldom found present, and among them were a good condition of the child, good surroundings for the patient, and a cervix so rigid that there would be great difficulty in dilating it and resorting to version. These three conditions were rarely met with in cases of placenta previa. A fourth condition was central implantation of the placenta.

DR. PHILANDER A. HARRIS, Paterson, N. J., said that when the statistics were analyzed as to the mortality of the mother and child, it would be found that the more rapid, prompt, and effective the delivery, the less the mortality, and the better the general results. If the case could be seen when the first hemorrhage occurred, it would be a favorable time for Cesarean section, but which he would not advise, but try to effect delivery by other methods.

DR. CHARLES JEWETT, Brooklyn, said the results under modern obstetric methods of treatment of placenta previa were good, whereas the mortality from Cesarean section was much larger than had been claimed by its advocates.

DR. A. PALMER DUDLEY, New York, said the general practitioner should be educated in regard to placenta previa. He should study his cases more carefully, and make a diagnosis of placenta previa sufficiently early to refer them to specialists, thus saving the lives of many children and mothers which otherwise would undoubtedly be sacrificed. He thought there was not much use in performing Cesarean section after a profuse hemorrhage had taken place. The danger of this operation, when properly and promptly performed, was almost nil.

DR. EGBERT H. GRANDIN, New York, said he would treat a case of placenta previa after the same manner that he would a case of carcinoma or sarcoma of the uterus. He would go at it with hammer and tongs, just as soon as he was sure of his diagnosis, and no matter what the period of gestation, he would empty the uterus. His experience had been fairly extensive, and his results from this hammer-and-tongs policy had been very favorable as regards saving the mothers. He had never had a mother die, although the mortality was considerable as far as the children were concerned. But usually these children were nearly dead when seen.

#### Two Conditions Simulating Ectopic Gestation.

DR. EDWARD P. DAVIS, Philadelphia, read a paper reporting a case of hematocele and one of retroverted gravid, simulating ectopic gestation. Second, Routier and Varnier have recently reported to the Obstetrical Society of Paris similar cases. In obscure cases of hemorrhage in which a diagnosis is not evident, he thinks abdominal section is safer than continued uncertainty. Conditions simulating ectopic gestation usually require prompt interference and surgical treatment.

DR. CHARLES P. NOBLE, Philadelphia, presented a clinical report on ureteral surgery.

DR. EDWARD REYNOLDS, Boston, discussed the principles underlying the repair of cystocele, and an operation founded thereon.

DR. E. E. MONTGOMERY, Philadelphia, spoke of the relative advantages of complete and partial hysterectomy.

#### A New Method of Anterior and Posterior Colporrhaphy.

DR. I. S. STONE, Washington, D. C., read a paper on this subject. In the anterior operation the vaginal wall is incised in the median line and, after clamping the sides of this incision, the bladder is pushed away, upwards and backwards, until its entire base is separated from the vaginal wall and from the anterior surface of the uterus, if desired. He extends this separation as far out laterally as possible, for the whole pelvic roof shares in the prolapse. He proceeds now to lift the bladder with fingers or gauze packing, or with a sound inside the organ as far upward as possible to assure the extent of liberation. The excessively long flaps which presented

over the base of the bladder as a cystocele (the distended anterior vaginal wall) are now excised, and the wound brought together edge to edge, taking care to entirely obliterate the cystocele and to leave the new anterior vaginal wall straight across. The method of applying the sutures is important, for he invariably sutures the flaps near the center of the wound to the anterior surface of the uterus with silkworm gut, silk or chromicized catgut. This is done for the double purpose of holding the bladder high above the former attachment on the uterus, and to hold the uterus forward if it has been retroverted. The bladder is held away and the deep sutures passed through the uterine wall between the attachments of the round ligaments. The wound is then entirely closed with catgut sutures. It will be noticed that he has applied the Mackenrodt method of vaginal fixation to his operation, but it was primarily to hold the bladder higher upon the uterus rather than to cure the displacement. In very large cystoceles the vaginal wall is greatly lengthened and can be shortened by removing a V-shaped section from each side of the incision in front of the cervix. The longitudinal wound in the median line will then join one made transversely across the vagina in front of the cervix.

As a test of the efficiency of the method, two patients with procidentia were selected, each with large cystoceles, who consented to operation in two stages. Both women were nearly sixty years of age. One had prolapse of twenty years' standing; the other, a stout, fleshy woman, had not suffered so long, and her disability was largely due to increase in weight. The vaginal relaxation of the thin woman was extensive and complete. The fat woman had not sustained as severe laceration as the other, but was hardly as good a subject, owing to the size of her abdomen. The anterior operation alone was done on these women, and while the uterus was not entirely retained within the vagina as a result of the work done, the cystocele was cured. One of these women had the final operation upon the posterior wall before she left the hospital; the other returned, nearly a year later, was treated in the same manner, and now both are well.

#### Posterior Secondary Operation.

Injury to the posterior vaginal wall and perineum differs greatly in its extent, and in the direction of the tear. The rent may be longitudinal or transverse, and in any event needs to be fully exposed below the vaginal mucous membrane, which in the past has borne the brunt of surgical attack, while the fascia, the objective point, is hiding with the much-discussed and rarely seen levator ani muscle, and is only influenced by sundry excursions of needle and suture, which, after all, only hold a denuded or scarified mucous membrane together while union progresses. The chest of the rectocele is grasped with the left hand, making a transverse fold which is divided with the scissors down to the rectum. Clamps are applied to the edges of the incision, and the rectum pushed away on both sides with union progresses. The crest of the rectocele is grasped with the vaginal wall. The incision in the vaginal wall is extended above and below until we are satisfied that we can secure sufficient narrowing of the vagina to answer the purpose in view. The sutures are placed with greater facility when the rectum is separated freely on each side, and one need not have any fear of not obtaining good union after the operation. After he has completed the liberation of the rectum, and has clamped such hemorrhoidal vessels as give trouble, he closes the wound in the following manner: With tissue forceps he catches up two points, one on either side, which he wishes to unite in front of the rectum. These points are usually about one and one-half inches below the edge of each flap, but the size of the rectocele will necessitate a test in each case, as directed, so that good approximation of the fascia over the rectum may be secured, which will not exert undue traction upon the sutures. The fascia is firmly and thoroughly united along the entire length of the wound. In some instances he has used a double tier of sutures which gives excellent support to the floor of the vagina, and makes a firm obstruction to the exit of a procident uterus. After the buried sutures are placed, he excises the long flaps from each side, and closes the vaginal incision with

interrupted catgut down to and rather below the former site of the crest of the rectocele. Emmet's or Hegar's method may now be selected for the final stage of the operation, according to the predilections of the operator. The operation in some respects resembles that of Hegar's, the chief difference being in the method of exposing the fascia.

#### A Consideration of Ovarian Fibromata, Based on a Study of Two Recent Cases, and Eighty-two Collected from the Literature.

DR. REUBEN PETERSON, Ann Arbor, Mich., after narrating cases said that while fibroma is one of the rarest forms of ovarian new growths, it is by no means such a rarity as was formerly supposed, as has been conclusively shown by Dornan, Briggs and Coe.

In the 84 tabulated cases, the age is mentioned in all but one. Fibromyomatous uterine tumors were about twice as often discovered from 40 to 50, as are ovarian fibromata, the percentage of the former being 51, as compared with 28 in the latter.

The conclusions were that (1) fibromata of the ovary occur earlier and in relatively greater numbers during early sexual life than do fibrous growths of the uterus; (2) while relatively the largest number of ovarian fibromata are to be found during or just after the menopause, a considerable percentage of cases occur proportionately later in life than do uterine fibromyomata.

Of the 66 cases in which the social state was mentioned, 22 were single, and 44 were married, showing the disease to be twice as common in married as in single women. The statistics do not bear out the statement of Dartigue, that pregnancy prior to the development of the tumor is rather a rare occurrence, since 75 per cent. of the 33 women, where fecundity is recorded, had had one child or more. The 28 women averaged four children each.

The cases were carefully reviewed regarding the effect of the ovarian fibromata upon the menstrual function. In only two cases is it definitely stated that the tumors gave rise to irregularity in the menstrual period. In 49 per cent. the statement is made that the patients were regular; six patients, or 12 per cent., are recorded as having had painful periods, but there is no evidence to show that the pain was produced by the ovarian growths.

The author thinks that neither menorrhagia nor metrorrhagia is a very constant accompaniment of fibroma of the ovary. It is more apt to occur where both ovaries are affected by the disease. The growth of an ovarian fibroma may exist for many years before the tumor reaches large proportions or gives rise to marked symptoms. In other cases the growth is more rapid, reaching considerable proportions and giving rise to noticeable symptoms in a comparatively short time, say a few months. Pain is present to a greater or less degree in nearly one-half the cases of ovarian fibromata. Freedom from pain means, as a rule, the absence of adhesions of the growth to the surrounding organs. Pain is more frequently met with in tumors of moderate size. Dysuria is a symptom in about 15.6 per cent. of the cases.

The growths were described as fibromatous in 63 out of the 84 cases, or in 75 per cent.; 48 of these were fibromata, 12 pure fibromata, and fibroma with colloid infiltration, fibrous with mucoid degeneration, and fibroid with hyalin and myomatous changes, one each; 17, or 20 per cent., were found to be fibromyoma; 2 were called myofibroma, and there was one each accredited to the myomas and to the myofibromas with hyalin degeneration.

#### Closure of Suppurating Abdominal Wounds Following Laparotomies.

DR. PHILANDER A. HARRIS, Paterson, N. J., said, when abscess forms in the abdominal incision the skin is reopened in the line of incision to the upper and lower limits of the mural abscess. The wound is then treated as an open one until the flow of pus becomes greatly reduced in quantity. All the granulations are then removed with a sharp curette until the muscle, fascia, fat and other tissues are distinctly recognizable. The separated edges of the deep fascia are then drawn together

by a series of silkworm gut sutures, which interlock each other at the apposition line of the fascia. Each one of these sutures is introduced through the skin about one inch away from the incision, and each one is brought out either just above or below the point of its introduction. If the first suture both enters and emerges from the right of the median line, the next one is introduced and emerges at a point to the left of the incision, and is so introduced as to interlock the first or preceding suture. The third suture is introduced and brought out from the same side as the first suture and interlocks the second one. The fourth suture is introduced from the same side as the second suture and interlocks the third or preceding one. This singular suture has for its chief object the coaptation of the deep fascia, and, when properly introduced and tied, it is claimed that the fat and opposing edges of the skin fall in apposition, adhere and heal without additional sutures. Most of the few cases thus treated promptly heal and generally do so without suppuration. A not unimportant part of the technic of operation is the thorough and repeated washing with a solution of bichlorid of mercury, always followed with a normal salt solution irrigation. The stitches are all removed on the twelfth and fourteenth day.

Fifteen photographs, which were exhibited, illustrate much of Dr. Harris' work in this relation. A not uninteresting part of the photographic illustration was the appearance of the wound after the sutures were introduced and tied, as they converted the area of the open and large wound into an elongated mound at whose base, on either side, there appears a row of knots, while at the summit of the mound the opposing edges of skin simply lie in apposition awaiting adherence and healing.

Dr. Harris is of the opinion that the stronger solutions of carbolic acid or possibly other disinfectants might serve as good, if not better, purpose than the solution of bichlorid of mercury which he has employed for this work.

#### Officers.

The following officers were elected for the ensuing year: President, Dr. Joseph E. Janvrin, New York; vice-presidents, Drs. Edward W. Jenks, Detroit, Mich., and A. Palmer Dudley, New York; secretary, Dr. J. Riddle Goffe, New York; treasurer, Dr. J. Montgomery Baldy, Philadelphia.

Washington, D. C., was selected as the place for holding the next annual meeting in conjunction with the Triennial Congress of Physicians and Surgeons, the first week in May, 1903.

9. **Basedow's Disease.**—Dana discusses the theory of the disease, giving his own view that the primary disease is in the nervous centers that control the nutrition of the thyroid and regulate its circulation. The factor of infection is also recognized, and he believes that the order of things when the disease has occurred is due to this perverse activity of the nervous centers, and that by building them up so that they recover their balance the thyroid becomes less stimulated and the system ceases to be poisoned by its excessive secretion. In cases where death occurs, the bulbar centers seem to be overpowered or exhausted. This is shown in a case that he reports here. The rarity of cases ending in death is remarked upon and the literature discussed. The characteristics shown in the fatal cases are the presence in the terminal stages of headache, vomiting, some fever, insomnia, delirium and evidences of paralysis of the cranial nerves. A second case is also reported running its course in 13 months, and is of interest, showing the rare accident of embolism in this disease.

10. **Supposed Gastric Perforation.**—In one of Smith's cases there was an autopsy performed showing a fatty degeneration of the liver and tuberculosis of the mucous membranes of the stomach, supporting the diagnosis of ulcer, but not explaining the symptoms.

12.—See THE JOURNAL of June 14, p. 1551.

13. **Intestinal Anastomosis.**—Wiggin describes the Maunsell methods of intestinal anastomosis, giving his reasons for preferring it to the Murphy button, and his objections to the latter. He criticises Connell's knot within the lumen method as of slight practical value and suggests that the passage of the needle from the outside in completing the knot might leave a point for leakage. He says in conclusion, the surgeon should remember, when he wishes to unite severed portions of the intestinal tract, that only normal and clean peritoneal surfaces should be united; that hydrozone diluted 50 per cent. with saline solution can be safely used to disinfect the peritoneum; that when employing the Lembert suture the needle must be made to include some fibers of the submucosa; that special care must be exercised in approximating the mesenteric borders of the intestine to include a portion of the mesentery; that there is no danger of cicatricial contraction following end-to-end union of divided intestinal ends; that there is no objection to the placing of secondary sutures in intestinal tissue when for any reason it seems necessary to do so; that the formation of intestinal adhesions can be prevented by leaving behind in the peritoneal cavity a quantity of saline solution when closing the abdominal wound; that ordinarily there is less danger to the patient in closing the abdominal wound after suturing the gut than in leaving the wound open and surrounding the injured parts with gauze packing; that union of the parts under favorable conditions is effected in about sixty hours; that a simple procedure by means of which an intestinal anastomosis can be easily effected, and which is adaptable to all parts of the intestinal tract, requiring in its performance only a few round sewing needles and suture material of either horsehair or silk, is decidedly preferable to methods necessitating the use of specially constructed instruments.

17.—Ibid., p. 1590.

18.—Ibid., p. 1560.

19.—Ibid., p. 1555.

20. **Food Preservatives.**—Leffmann finds little evidence to

show that boric acid or borax, in the methods used, is harmful. Large doses have caused harm, but the same has been done by salt, saltpeter, etc., which are in other preservatives.

21.—See THE JOURNAL of June 14, p. 1551.

22. **Laboratory Apparatus.**—Smith's article describes and illustrates the Matlock bucket as a substitute for the steam bath, a special type of filtration bath, the U. T. thermostat, arrangements for incubators, and an anaërobic jar.

23. **Gastric Conditions.**—Chase has experimented on forty students, presumably healthy, of the Tufts Medical College. The subjects were instructed to fast from the evening meal until the time of examination on the following morning; with two exceptions they fasted for over ten hours. Then the Ewald test meal was given, and at the end of one hour the stomach contents were removed with a suction bulb. Water was poured into the stomach until the subject felt he could stand no more, when the amount was recorded, and on its withdrawal, an approximate idea of any residual contents from the test-meal was obtained, but rarely did it seem of an appreciable amount. By means of a two ounce or 60 c.c. inflation bulb the stomach was moderately distended with air, the number of bulbs required being noted. The area of stomach resonance was then determined by gentle to moderate percussion; when doubt existed, auscultatory percussion was also employed. The relation of the greater curvature to the center of the navel in the median line was ascertained, then the highest zone of stomach resonance in the same line, the distance between the two points being recorded as xipho-umbilical resonance. The greatest distance of stomach resonance to the right of the median line is recorded as pyloric resonance. The costal cartilage under which the greater curvature passed was noted, also the rib corresponding to the greatest height of the stomach-lung resonance and the axillary line to which the resonance extended to the left. The iodoform test for motility was made but is not discussed in this article. The amount of contents in the stomach averaged in 39 cases, 13.5 ounces, the maximum being 190 c.c., the minimum 30. The results correspond very closely with those of Hewes; a little lower than the German standard. In 23 of the 39 cases the lower border of the stomach was found above the umbilicus, in 16 it was at or below. The average distance above was one inch. Chase is inclined to think that there is a certain degree of atony or dilatation existing without symptoms in many cases, and he quotes a special one to prove this point. If the Germans, however, excluded in their statistics such cases as these the difference in results can be attributed to the presence of such cases in his own series. If not, atony or dilatation with stasis but without subjective symptoms would seem to be a common condition in the American stomach. He thinks the difference between the positions of the lower border in the inflated and the uninflated stomach is about one inch. In the 39 cases the average xipho-umbilical resonance was  $4\frac{1}{2}$  inches, the maximum  $6\frac{1}{8}$ , the minimum  $2\frac{1}{4}$ . In 28 of the 39 the greater curvature was found to pass under the ninth costal cartilage, in 7 cases it was at the eighth, and in the remaining 4 cases it passed under the tenth cartilage. In 3 of the 4 cases in which the curvature passed under the tenth cartilage it was also found below the navel. The stomach-lung resonance in 39 cases was found to extend up to the sixth rib in 19, to the seventh rib in 15, to the fifth rib in 4, and to the eighth rib in one case. In 18 cases this resonance extended to the left, to the anterior axillary line, in 17 cases to the midaxillary line, and in 4 cases to the posterior axillary line. The average range of pyloric resonance was  $2\frac{1}{4}$  inches, the greatest  $3\frac{1}{2}$ , and the least  $1\frac{1}{2}$ . The liquid capacity of the stomach averaged about  $2\frac{3}{5}$  pints; the largest  $5\frac{1}{5}$ , and the smallest  $\frac{4}{5}$  of a pint. He thinks the results of the test probably depends more on the tolerance of the stomach than on its capacity, and that it is of little importance and should not be relied on to the prejudice of inflation and percussion tests. In 31 cases where free HCl was present the mean amount was 1.7 per m.; the largest amount in any case was 3.6 per m.; the smallest amount .8 per m. In four cases no free HCl was detected. He wishes to call attention especially to the larger amount of contents than has been considered normal and to the relation of the lower border

of the stomach to the navel, as, according to Ewald, pathologic conditions must have been present in nearly one-half these cases, but in no case was there any gastric disturbance.

28.—See THE JOURNAL of June 14, p. 1551.

29. **Tuberculosis.**—The relation of bovine tuberculosis to human health is thoroughly treated by Adami, who notices the spread of tuberculosis among cattle and the necessity of its arrest. In his opinion as to the danger of milk from tuberculous animals, germs may be present, whether the udder is diseased or not, though their numbers would be very few in the latter case. He thinks that there is a possibility of infected milk starting up infection in young children and in susceptible individuals and that, therefore, we should not belittle the risk. Every community has a right to demand pure milk, as badly kept milk, milk utensils, etc., may be a very serious cause of infant mortality.

34.—See THE JOURNAL of June 14, p. 1551.

38.—See THE JOURNAL of June 14, p. 1551.

39.—*Ibid.*, p. 1560.

43. **Gastric Ulcer.**—Fütterer notes the forms of gastric ulcer and criticises the term round ulcer as not usually being sufficiently descriptive. He lays special stress on the fishhook form of ulcer as indicating the secondary development of carcinoma. This is as characteristic as the Hauser sign or bending forward of the muscularis toward the mucosa. As regards diagnosis he does not think it well to lay too much stress on the so-called classical symptoms. Pain is most constant, and when it occurs he is inclined to suspect ulcer if the patients are chlorotic or have secondary anemia, and are afraid to eat solid food, and it is better to anticipate than to wait for hemorrhage to confirm the diagnosis. He would treat every case of gastric ulcer as if it were in danger of hemorrhage and perforation. All cases that do not call for immediate surgical interference should be subjected to thorough medical treatment.

44. **The Surgeon's View of Stomach Ulcer.**—Andrews believes that there is an inaptitude and want of originality in stomach surgery and a false conservatism and timidity that keeps back operative interference when it is desirable. He pleads for early operation in stomach ulcer, which is a surgical disease like appendicitis, but with less chance of recovery. He reviews the methods of operating, and thinks that any case that has resisted medical treatment should be considered suitable for operative interference.

45. **Gastric Carcinoma.**—The importance of operation for gastric carcinoma is indicated by the fact that life expectancy is put down by Osler as less than one year in 75 per cent. of cases and less than 6 months in 50 per cent. of cases; Murphy thinks the period, however, longer than this. The younger the patient the more rapid the disease. Exploratory laparotomy is too infrequently performed. The various operations of gastrectomy, pylorotomy, gastroenterostomy, gastrectomy, jejunostomy, etc., are noticed. Gastrectomy should be limited to cases where there is annular carcinoma of the esophagus. The Frank and Witzel operations are the ones of choice, with many points in favor of the former. The paper is largely a review of the literature and the opinions of others in regard to the estimation of recovery, successful operations, etc.

46. **Death from Stomach Operations.**—Turck's paper reviews the literature of operations on the stomach, noting the causes of death, and remarks that in every operation we should regard the stomach as an infected cavity. There is usually a condition of chronic toxemia and the remedy lies in the more careful treatment of the infected stomach on the one hand and on the other increase of the physiologic resistance of the patient. He speaks particularly about the danger of shock and narrates experiments made on dogs from which he deduces the following conclusions: 1. Shock lessens the resistance to infection. 2. In prolonged shock some toxin seems to be formed that can produce shock in another animal of similar species. 3. Toxins possess a degree of hemolysis. We are, therefore, confronted with three principal dangers, viz., toxemia, infection and shock, and any operation may so precipitate the latent symptoms that we must in every case use proper prophylaxis

against such conditions before attempting operation. He insists on the importance of rendering the stomach as aseptic as possible and securing a reduction of toxemia, protecting from shock, reduction of splanchnic congestion and other cardiovascular disturbances and anemia, reducing atony of the stomach and intestines, and the restoration as far as possible of the nutritive standard and general metabolism. During and after operation we should seek to preserve the equilibrium of the circulation, restore the gastrointestinal atony that follows every operation, encourage elimination, keep the stomach as aseptic as possible, and employ appropriate diet to meet the conditions. The details of treatment are mentioned, though he remarks that they require much more extensive treatment than he has space for here. He insists on the importance of thorough washing out of the stomach and suggests, among other things, spraying it with oil of cloves which acts as an antiferment and analgesic. He also recommends the use of his double tubes with cold and hot moist air stimulation and also the intragastric bag. These methods have been found advantageous not only by himself but by Herschel, Treves, Gillespie and others. As regards dietetics, he speaks particularly of gelatin as a valuable addition. It is not only an albumin sparer, but a preventive of hemorrhage. Rectal feeding will have to be resorted to to some extent and from one to several days before the operation no food should be taken by the mouth, rectal feeding and saline infusion being relied upon. He remarks particularly as to the use of his intragastric bag as a preventive of shock when employed with heated water. To prevent skin infection rubber shields or artificial skin applied around the operative field is of value. Instead of wet sponges for heat applied to the viscera he would use the small thin rubber hot water bags. The rubber bags to be placed within the cavity should be made absolutely sterile, then partially filled with sterile water and heated in a receptacle to the desired temperature, which he has found to be 118 F. and a fraction. Following the operation the stomach should be washed if there are any signs of vomiting and other undesirable symptoms. Gastric and colonic lavage repeated, salt infusion, feeding by rectum and no food by the mouth for twenty-four to forty-eight hours are in order. In case of rapid depression the hot water intragastric bag with a continuous flow will be found of service. In operations for gastric fistula, we can use lavage of the stomach through the fistula, especially when the valve operation of the author is used. The keynote of success is the preparation of the patient's general condition before operation. For further details the article itself should be consulted.

1. **Tuberculin.**—Wilkinson believes in tuberculin as a remedy for tuberculosis, but insists that it is a specific remedy not available in mixed infection, where it may do harm. Fever is a danger signal usually indicating this condition, though it may exist in its absence, and on the other hand may itself be absent in mixed disorders. Tuberculin can do no good for other infections than tuberculosis. He holds that it should be also used as a measure of prophylaxis in all sanatoria.

2. **Control of Tuberculosis.**—The conclusions of Pattin's article are given as follows: 1. Reliable information as to the whereabouts of tuberculous cases which, in his judgment, can be acquired by obligatory notification only. 2. Vigorous adoption of consequential administrative measures as to destruction of sputum, etc., and disinfection and improvement of affected dwellings, and sometimes their condemnation and removal. 3. Provision of sanatoria for recuperative treatment either by sanitary authorities singly or conjointly. 4. Instruction in all elementary schools in the means of propagation, and the methods of prevention, in dealing with tuberculous diseases. With the adoption of the above measures, he says we may hope greatly to diminish the untimely yield of human lives which is now garnered annually by the tubercle bacillus; to say nothing of the lessening of the pain and misery which too often makes those who should be healthy and useful members of our national family pathetically hopeless and practically dangerous.

6. **Thrombosis.**—Gould's third lecture, the former ones having been published in the *Lancet*, March 1 and 15, takes up the subject of thrombosis. He insists on the rejection of any theory of hyperinosis, but holds thrombosis is due to some agent inducing separation of the fibrin from the plasma and the causes of the change may be supposed to be either in the corpuscles, in an increase in viscosity of the platelets, an increase in the fibrin ferment, or an increased liberation of fibrin ferment. It is possible that various micro-organisms or their toxins may influence the formation of platelets or produce

fibrin fermentation; the tendency of the clot to extend bears on this question. The medical conditions which influence blood clotting are changes in the nutritive conditions of the walls and in the regular equable flow of the blood. The latter suggests a sudden dilatation, the entrance of a small vein into a larger one, etc. He calls attention to two modifications of the circulation, regurgitation from deep into superficial veins which is so constant in varicose conditions and there is no doubt that thrombosis is much more common in varicose veins than in others. The other alteration is that produced by a block in the main artery. The thrombosis extends up the artery toward the heart and not in the direction of the circulation, as in the cases of the vein. Another important modification is the great enfeeblement of the heart. He describes several forms of thrombosis, giving the name of endophlebitis obliterans to a type which he thinks is closely allied to cases of arteritis obliterans.

**13. Cancer in India.**—The prevalence of cancer in India is noticed by Niblock, who calls attention to the increased proportion of carcinomas of the cheek and jaws, which he thinks is due to betel-nut chewing, also carcinoma of the penis, which seems to be very common among the poorer classes, and due to unsanitary habits. The Mohammedans are comparatively free from it, being circumcised. In Madras cancer is by no means infrequently met with.

**14. Malignant Disease in Kashmir.**—Neve gives the facts of malignant disease in Kashmir, calling attention to the comparative frequency of cancer, the great majority of cases being epithelial, due to "kangri burns" from portable stoves, which they carry under their clothing. Sarcomata are also moderately common, the majority are of the large celled variety, round or spindle-celled. The patients frequently pay little attention to them as long as function is not impaired, hence surgical treatment is embarrassed.

**19. Extirpation of Glands in Case of Carcinoma Uteri.**—Herff reports a permanent cure in 21.7 per cent. of 213 cases of carcinoma in the uterus operated on more than three years ago. Omitting those that have been lost sight of, the percentage is 25.1 per cent. The proportion of permanent cures among 124 patients operated on more than seven years ago is 19.3 per cent., and omitting those lost sight of, 23.7 per cent. The total mortality in the group of 213 cases was 4.6 per cent. Assuming that no more than half of the cases had the glands involved, the recoveries would evidently have been more numerous if the glands had been extirpated at the same time. In order to simplify and facilitate the technic, Herff incises across from one spine to the other, above the pubis, and recommends this method of procedure for extirpating the glands in such cases.

**20. Drainage After Symphysiotomy.**—Zweifel reiterates that in comparison with the importance of the treatment of the prevesical space all the other steps of symphysiotomy are insignificant. He drains it through the vagina, using a glass tube long enough to project from the vulva. A double thread is fastened to its upper end and is brought out through the wound on the mons veneris, where it is loosely tied over one of the threads of the suture. In four days it is untied and the tube is drawn out from below, a little at a time.

**21. Artificial Tubal Sterilization.**—Ehrendorfer describes a case in detail to demonstrate the benefits of wedge excision for the removal of sound tubes on each side in case of imperative necessity for the prevention of conception. Menstruation is retained, while the power of conceiving is completely abolished.

**24. Congenital Perithelial Tumor.**—Füth claims that the tumor he describes is the only known example of its kind. It was in the gum of a girl baby two days old, and although it did not start in the enamel germ yet it had involved the latter in its growth. It was as large as a hen's egg and protruded from the mouth at birth. After its removal the teeth developed normally except the two upper incisors, which are rudimentary and gray in color. The child is now a healthy two-year-old. Six cases are on record of perithelial tumors of the ovary, of which three were malignant.

**26. Cases of Myoma Operated on at Zurich.**—Schwarzenbach reports the results of surgical intervention in 393 cases of myoma. The mortality of 77 treated by supravaginal amputation was only 4 per cent., while it was 9 per cent. in 31 treated by total hysterectomy.

**29. Pterygium Colli.**—Fincke operated on the patient whose case is described, and with the most satisfactory results. He attributes the deformity to amniotic adhesions and not to atavism as has been suggested.

**30. Treatment of Flat Foot.**—Nicoladoni divides the tendo Achillis lengthwise into two parts up into the triceps. One of the parts he passes through a slit in the tibialis and turns it back on itself and sutures it to fasten it with considerable traction. The loop thus formed, passing through the tibialis, strengthens the latter and induces correct anatomic traction which remedies the tendency to flat foot. The insole to be worn is mounted at the center on an axle which raises it about an inch above the sole of the shoe. A peg at the heel prevents the heel from falling below the level of the axle at the center, but the fore part of the foot has free motion up and down.

**33. Avoidance of Post-Operative Peritoneal Adhesions.**—Vogel does not assert that post-operative peritoneal adhesions can be banished from the world by following his suggestions, but he is evidently privately convinced that such is the case. His extensive experimental and clinical researches have demonstrated that the formation of adhesions can be prevented by not allowing the raw surfaces to rest against each other long enough for adhesions to form. If the position of the intestines in regard to each other is constantly altered, adhesions can not develop. After the injured surfaces of the serosa have become coated once more with endothelium this restores their normal protection against the formation of adhesions. Frequent changes in position after a laparotomy should be supplemented by measures to promote active and passive movements of the intestines. Active peristalsis was most effectually promoted in his experimental research by subcutaneous injection of physostigmin salicyl.; passive movements by separating the surfaces in contact by the intraperitoneal application of a thick solution of gum Arabic in physiologic salt solution. Physostigmin has a vigorous action in promoting peristalsis while it spares the stomach and does not affect the general health. He recently used it after a laparotomy done on account of ileus following long constipation. It proved remarkably successful. He has followed these principles in the post-operative treatment of five patients. The patient can be turned on the side five to eight days after a laparotomy if the suture was well done. If catgut was the only material used this might be dangerous, and he therefore advises a combination of silver wire and catgut. He urgently recommends to others the principles of early change of position, gentle massage during healing of wound and later gymnastics of the abdomen.

**36. Ruptures of the Liver.**—Finkelstein has collected 21 cases in which rupture of the liver was followed by recovery. Only 3 were sutured. In 14 tampons alone were used and in 1 tampons and sutures. One was cauterized with steam and in 2 the rupture was left to heal spontaneously as the operation showed that the hemorrhage had been spontaneously arrested. Secondary hemorrhage occurred later in these two cases, compelling resort to tampons. On account of the danger of this, it is always advisable to apply tampons even if there is no hemorrhage at the time. They should be detached and removed later one at a time.

**48. Serum Exanthemata.**—Rittershain announces that he has only been able to find 6.45 per cent. as the statistics of exanthemata following serum treatment during the last four years. Before that, the statistics showed that 22 per cent. were affected with an exanthem. When it resembles the eruption of scarlet fever it is advisable to isolate the child to avoid all chances of possible contagion.

**54. Tropicocain in Eclampsia.**—The case of eclampsia reported was distinguished by the immediate arrest of the eclamptic seizures by spinal tropicocainization. Not even an abortive attack occurred after it, although eighteen severe ones

had preceded it. The patient roused from profound coma and regained consciousness. Pulse and temperature returned to normal and a viable child was delivered without pain. After a period of euphoria the patient died with symptoms of a severe liver affection which could be attributed only to processes in the liver caused by the penetration of toxic substances from the fetus through the placenta into the maternal circulation. These processes terminated in necrosis and they must have occurred before the first appearance of the eclampsia or as a consequence of it. Death was due to insufficiency of the heart in consequence of pneumonia of the left upper lobe. This diagnosis was confirmed by the autopsy in every respect. Von Winckel asserted so long ago as 1865 that the danger for the pregnant woman in eclampsia is materially or entirely abolished by the death of the fetus, which arrests the passage of toxic substances from the fetal into the maternal circulation.

**56. Etiology and Significance of Malum Perforans Pedis.**—This communication from Neisser's clinic emphasizes the importance of this affection as an early manifestation of arteriosclerosis, diabetes mellitus or trophic disturbance dependent on some cerebral, spinal or peripheral nerve lesion. Cases are on record in which it was the first sign of impending tabes or other serious affection. The pulse in the foot should be investigated, the urine examined for sugar, etc. If ulcer does not occupy the typical spots and persists for years without evidences of a nervous or general affection, it is probably of another nature. He describes the case of a blacksmith who had suffered for twelve years from a chronic ulceration on the sole of one foot. Symptoms of syringomyelia then developed which brought him to the doctor. The ulceration healed completely in about four weeks under rest in bed, local treatment and a course of iodine.

**57. Differential Diagnosis of Multiple Sclerosis.**—The German regulations in regard to industrial insurance and pensions are producing a crop of traumatic affections which require the utmost skill on the part of the physician to distinguish between hysteria, simulation and actual morbid conditions. The contributions to literature in this line are becoming more and more numerous. Treupel describes several cases of multiple sclerosis which were puzzling at first. It developed in one case after getting chilled from standing in very cold water to the hips. The first symptom was a disturbance in the speech. This was followed by retention of urine and stools, neuralgias, staggering gait, irresistible laughing and tremor. Another case commenced after a trauma with paralysis of the legs and tremor with nystagmus, but time alone can decide whether it is not merely hysteria and simulation of which there is a suspicion. In another case the diagnosis wavers between sclerosis and paralysis agitans, although the atrophy of the optic nerve speaks in favor of the former. It occurs in 50 per cent. of all cases, he states, and in about 15 per cent. is the first and for a long time the only symptom of multiple sclerosis.

**61. Gelatin in Melena Neonatorum.**—Called to an emergency case of melena neonatorum in a healthy family, Döllner injected 40 c.c. of a 2 per cent. solution of gelatin in four doses in five hours. All the symptoms rapidly subsided. He attributes the melena in such cases to an abnormal permeability of the vessels which became rapidly repaired. This would explain why the melena did not recur after the action of the gelatin had subsided. He used a combination of 2 parts white gelatin to .12 parts sodium chlorid in 100 parts water, at the temperature of 100.5 F., making the injections near the inner margin of the scapula.

**65. Questions of the Day in Sanatorium Treatment.**—Among the points emphasized by Nahn is that before a patient is admitted to a tuberculosis sanatorium his teeth must be in good order and he must be free from complicating gastrointestinal disorders, laryngeal tuberculosis and albuminuria. The prospects of recovery depend on a good stomach, good teeth and a good heart. Hemoptysis frequently sends the subject to the physician at an early stage and is thus an advantage. When patients are dismissed from a sanatorium they should reside permanently in the country. Immense progress would be

gained if on leaving the sanatorium the patients could step at once into some remunerative occupation in the country. He urges the establishment of colonies for the purpose.

**71. Medicated Lavage of the Organism.**—Rinsing out the organism by means of the circulation will eliminate even a lethal dose of toxin in certain circumstances, as Sanquirico has established by previous research. The injection into the circulation of bacterial products was able to enhance the resisting powers of the organism and render it an unfavorable soil for the development of certain microbes. He also found that the injection of a strongly bactericidal substance was compatible with life in certain conditions. He proclaims that the arresting of the vital processes of bacteria is not enough in the struggle against certain diseases. We must also aid in expelling their poisonous products from the system more rapidly than is possible by the natural emunctories alone. The experimental research reported in this communication was undertaken to determine the amount of an antiseptic substance which can be safely injected into the circulation to accomplish the desired medicated lavage of the organism. With sublimate, 2 mg. per kilogram seemed to be the limit of the dose that was tolerated; 20 cg. of thymol per kilogram in the twenty-four hours; 17 cg. of argonin per kilogram and 4 cg. of protargol per kilogram. Very toxic substances are not applicable for the purpose nor those affecting the heart or renal functions.

**73. Inhibition and the Hypnotic State.**—Gallerani reports the results of numerous tests with the sphygmograph, pneumograph, etc., to investigate the true essence of hypnotism. The conclusions are that the phenomena observed in the hypnotic state are due to an influence on the inhibiting centers of the brain or to superexcitation of the centers of automatic movements. The facts observed establish the existence of centers of interference, of inhibition, of control, in the cortex, which normally have an inhibiting action on the automatic functions, on the vascular and respiratory tonus. If these inhibiting centers are arrested in their action, the centers under their control behave irregularly and the eccentric electro-negative condition of the organism is increased, especially in the muscular domain.

**75. Cutaneous Affection from Primroses.**—Lyantz has observed four cases of the inflammatory process in the skin traceable to the primula obconica. All the patients were adults. The affection resembled in every respect acute eczema, and usually healed on the removal of the cause, as has been the experience of others who have observed this "primula inflammation." But in a few instances it has been known to persist as a chronic eczema.

## Queries and Minor Notes.

### TIME FOR EUROPEAN EYE AND EAR STUDY.

CROOKSTON, MINN., June 13, 1902.

*To the Editor:*—Would the summer or winter session be the best for studying at the London, Vienna or German eye and ear clinics?  
G. A. M.

*Ans.*—From good authority we learn that the best time for study or observation of methods at the London eye and ear clinics is the summer, and at the continental ones the winter session.

### LAWS ON MEDICAL PRACTICE.

OXFORD, MD., June 18, 1902.

*To the Editor:*—Will you kindly give me the requirements of the different states for registration in medicine or let me know where I can get them and oblige.  
H. H. J.

*Ans.*—THE JOURNAL has published an abstract of the laws of the different states in its issue of Nov. 16, 1902, and revised to date Jan. 1, 1902, a copy of which may be had for 25 cents.

### A WORK ON MASSAGE OF THE LIVER.

CHICAGO, June 16, 1902.

*To the Editor:*—Will you kindly inform me if the study of "Actual Massage of the Liver," by De Frumerie is obtainable and given in English?  
I. L. G.

*Ans.*—We are not informed of any English or American translation of the work; it is quoted as published at Paris in 1901

## The Public Service.

### Army Changes.

Movements of Army Medical Officers under orders from the Adjutant-General's Office, Washington, D. C., June 5 to 11, 1902, inclusive.

W. Edson Apple, captain and asst.-surgeon, Vols., now at Philadelphia, Pa., will, on the expiration of his present leave of absence, report for temporary duty at Columbus Barracks, Ohio.

Harry D. Belt, contract surgeon, on the expiration of his present leave of absence, to proceed from Kenton, Ohio, to Fort Keogh, Mont., for duty.

Christopher C. Collins, lieutenant and asst.-surgeon, U. S. A., leave of absence for one month granted, with permission to apply for an extension of two months.

Elmer A. Dean, lieutenant and asst.-surgeon, U. S. A., relieved from further duty at the General Hospital, Presidio of San Francisco, and assigned to duty at Columbia Arsenal, Columbia, Tenn.

William H. Forwood, colonel and assistant surgeon-general, former orders directing him to proceed to Saratoga, N. Y., to represent the Medical Department of the Army at the fifty-third annual meeting of the American Medical Association, revoked.

Alfred C. Girard, lieutenant-col. and deputy surgeon-general, on being relieved from command of the General Hospital, Presidio of San Francisco, to proceed to Washington, D. C., for duty in the office of the Surgeon-General.

Herbert I. Harris, contract surgeon, former orders relating to Contract Surgeon Herbert W. Hatch, amended to read Herbert I. Harris, member of a board at Chickamauga, Ga., to examine officers of the Army for promotion.

Eugene H. Hartnett, lieutenant and asst.-surgeon, U. S. A., leave of absence for two months granted, with permission to go beyond sea.

Oliver M. Holliday, contract surgeon, now at Burrton, Kan., to proceed to San Francisco, en route for assignment in the Division of the Philippines.

William P. Kendall, major and surgeon, U. S. A., on being relieved from duty at Fort Porter, N. Y., to proceed to San Francisco, for assignment to the command of the General Hospital at that place, relieving Lieut.-Col. Alfred C. Girard, deputy surgeon-general.

Donald P. McCord, captain and asst.-surgeon, Vols., now at San Francisco, to duty as transport surgeon of the transport *Warren*.

Edward L. Munson, captain and asst.-surgeon, U. S. A., member of a board of survey convened at the War Department, Washington, D. C.

Robert H. Pierson, contract surgeon, now at Syracuse, N. Y., to duty at Fort Columbus, N. Y.

Edward W. Pinkham, lieutenant and asst.-surgeon, U. S. A., former orders accepting his resignation, to take effect June 10, 1902, revoked.

John J. Reilly, lieutenant and asst.-surgeon, U. S. A., from Fort Slocum, N. Y., to duty at Fort Porter, N. Y., relieving Major William P. Kendall, surgeon, U. S. A.

George M. Sternberg, brigadier-general and surgeon-general, U. S. A., retired from active service, June 8, 1902, by operation of law, having reached the age of 64 years.

Frank F. Woodbury, lieutenant and asst.-surgeon, U. S. A., relieved from further duty in the Division of the Philippines, to proceed to San Francisco, and on arrival report by telegraph to the Adjutant-General of the Army for instructions.

### BOARD CONVENED.

Board convened to meet in Washington, D. C., June 7, 1902, for the physical examination of candidates for admission to the Revenue Cutter Service. Detail for the Board: Surgeon R. M. Woodward, chairman; Asst.-Surgeon A. J. McLaughlin, recorder.

### Health Reports.

The following cases of smallpox, yellow fever, cholera and plague have been reported to the Surgeon-General, U. S. Marine-Hospital Service, during the week ended June 14, 1902:

#### SMALLPOX—UNITED STATES.

California: San Francisco, May 18-25, 6 cases.  
Colorado: Denver, May 24-31, 1 case.  
Florida: June 4, Oahkhill, 4 cases; Palmetto, 1 case.  
Illinois: Belleville, May 31-June 7, 1 case; Chicago, May 31-June 7, 21 cases; Freeport, May 24-31, 2 cases.  
Indiana: Indianapolis, May 24-31, 8 cases; Muncie, May 1-31, 9 cases; South Bend, May 24-31, 2 cases; Terre Haute, May 24-31, 1 case.  
Iowa: Ottumwa, May 3-31, 7 cases.  
Kansas: Wichita, May 24-31, 4 cases.  
Kentucky: Covington, May 31-June 7, 16 cases.  
Maryland: Baltimore, May 31-June 7, 1 death; Cumberland, May 1-31, 1 case.  
Massachusetts: May 31-June 7, Boston, 16 cases, 5 deaths; Cambridge, 3 cases, 1 death; Chelsea, 1 case; Everett, 2 cases; Lowell, 5 cases; Malden, 1 case, 1 death; Somerville, 4 cases.  
Michigan: Detroit, May 31-June 7, 9 cases, 1 death; Grand Rapids, May 24-June 7, 2 cases; Ludington, May 17-June 8, 28 cases.  
Nebraska: Omaha, June 1-8, 23 cases; South Omaha, May 25-June 1, 33 cases.  
New Hampshire: Nashua, May 31-June 7, 7 cases.  
New Jersey: Hudson County, Jersey City included, May 25-June 1, 38 cases, 6 deaths; Newark, May 31-June 7, 33 cases, 13 deaths; Passaic, May 25-June 7, 1 case.  
New York: New York, May 31-June 7, 63 cases, 19 deaths; Yonkers, May 30-June 6, 1 case.  
Ohio: Hamilton, May 31-June 7, 5 cases; Cincinnati, May 30-June 6, 12 cases, 1 death; Cleveland, May 31-June 7, 61 cases, 1 death; Toledo, May 25-31, 3 cases, 1 death.  
Pennsylvania: Johnstown, May 31-June 7, 2 cases; McKeesport, May 31-June 7, 1 case; Philadelphia, May 31-June 7, 16 cases, 2 deaths; Pittsburgh, May 24-June 7, 48 cases, 3 deaths.  
Rhode Island: Providence, March 31-June 7, 1 case.  
South Dakota: Sioux Falls, May 24-31, 1 case.  
Utah: Ogden, May 1-31, 8 cases; Salt Lake City, May 25-31, 3 cases.  
Wisconsin: Green Bay, June 1-8, 3 cases; Janesville, May 25-June 7, 3 cases; Milwaukee, May 31-June 7, 4 cases.

#### SMALLPOX—INSULAR.

Philippines: Manila, April 19-26, 4 cases, 2 deaths.

#### SMALLPOX—FOREIGN.

Belgium: Antwerp, May 17-24, 7 cases, 3 deaths.  
Brazil: Rio de Janeiro, April 20-May 4, 8 deaths.  
Canada: Quebec, May 24-June 7, 19 cases; Vancouver, May 1-31, 1 case; Winnipeg, May 31-June 7, 1 case.  
China: Hongkong, April 12-26, 7 cases, 3 deaths.  
Colombia: Bocas del Toro, May 12-19, 1 death.  
France: Rheims, May 18-25, 1 case.  
Great Britain: Birmingham, May 19-24, 6 cases, 1 death; Glasgow, May 22-29, 1 case, 1 death; Liverpool, May 19-24, 1 case; London, May 17-24, 307 cases, 24 deaths.  
India: Bombay, April 29-May 13, 16 deaths; Calcutta, April 26-May 10, 8 deaths; Karachi, April 20-May 11, 8 cases, 5 deaths; Madras, April 26-May 2, 2 deaths.  
Italy: Palermo, May 10-24, 24 cases, 9 deaths.  
Japan: Formosa, Feb. 1-March 31, 169 cases.  
Mexico: Vera Cruz, May 24-31, 2 cases, 1 death.  
Russia: Moscow, May 10-17, 25 cases, 1 death; Odessa, May 17-24, 13 cases, 3 deaths; St. Petersburg, May 3-17, 21 cases, 3 deaths; Warsaw, April 19-May 3, 4 deaths.

#### YELLOW FEVER.

Brazil: Rio de Janeiro, April 19-May 4, 93 deaths.  
Mexico: Vera Cruz, May 24-31, 35 cases, 14 deaths.

#### CHOLERA—INSULAR.

Philippines: Manila, March 20-April 27, 496 cases, 400 deaths; Albay Province, March 30-April 27, 3 cases; Bataan Province, March 30-April 27, 694 cases, 555 deaths; Bulacan Province, March 30-April 27, 231 cases, 216 deaths; Camarines Province, March 30-April 27, 696 cases, 488 deaths; Cavite Province, March 30-April 27, 10 cases, 8 deaths; Ilocos Norte Province, March 30-April 27, 2 cases, 2 deaths; Laguna Province, March 30-April 27, 2 cases, 2 deaths; Pampanga Province, March 30-April 27, 292 cases, 202 deaths; Pangasinan Province, March 30-April 27, 3 cases, 3 deaths; Rizal Province, March 30-April 27, 163 cases, 112 deaths.

#### CHOLERA—FOREIGN.

China: Hongkong, April 12-26, 49 cases, 45 deaths.  
India: Bombay, April 29-May 13, 3 deaths; Calcutta, April 26-May 10, 156 deaths.  
Straits Settlements: Singapore, April 19-26, 52 deaths.

#### PLAGUE.

China: Hongkong, April 12-26, 12 cases, 11 deaths.  
India: Bombay, April 26-May 13, 791 deaths; Calcutta, April 26-May 10, 721 deaths; Karachi, April 20-May 11, 393 cases, 342 deaths.  
Japan: Formosa, Feb. 1-March 31, 375 cases, 277 deaths; Nagasaki, May 14, 1 case, 1 death.

# GENERAL INDEX.

Use of the index will be facilitated by bearing in mind that subjects are frequently given under two or more headings, e. g., brain, cerebral, tumors, etc.; heart and cardiac; cirrhosis, liver and hepatic; child, children and infant; gland, thyroid, etc. Often, too, writers treat of the eye, ear, nose and throat under one head, etc., and the titles do not always permit of indexing under the several headings. The "General Index" contains only titles of articles, editorials, society reports, abstracts, and miscellaneous matter appearing in The Journal; the book notices, deaths, societies, marriages, authors, and titles of articles mentioned in the "Current Medical Literature" department are indexed and arranged under their separate headings instead of in the body of the "General Index."

- Abbott, A. C., pseudotubercle bacilli, 1325  
A. W., intestinal exposure, 125  
Abdominal and pelvic surgery, conservatism in, 1595

 infection, 671  
 inherited, 1402  
 intercommunicability of human and bovine, 1517  
 intestinal, 204  
 intestinal, and amyloid degeneration, 432  
 laryngeal, 481, 1275, 1277  
 laryngeal, in children, 485  
 laryngeal, treatment of, 1120  
 lymphatic, 358  
 mechanical predisposition to, 1338  
 medicinal treatment of, 1678  
 medicinal treatment of fever in, 211  
 need of sanatoria for, 196  
 new etiology of, 486  
 nineteen years' experience with creosote in, 291  
 of cervical glands, 902  
 of intestine, medical treatment of chronic, 335  
 of seminal tract, 1261  
 of the stomach, 1376  
 of testicle, 1261, 1276  
 of testicle, analysis of cases of, 1607  
 of tonsils, 358  
 open-air treatment of, 736  
 pancreas in, 1481  
 peritoneal, 132  
 peritoneal, surgery for treatment of, 181  
 popular deception in, 1465  
 pre-historic American, 1404

- Tuberculosis, prevention of, 186  
prevention of, in Texas, 1464  
primary intestinal in children, 132  
pulmonary, 1044, 1544  
pulmonary, early diagnosis of, 57, 207  
pulmonary, etiology of, 850  
pulmonary, indications for abortion in, 909  
pulmonary, sanatorium treatment of, 69  
pulmonary, serum diagnosis in, 445  
pulmonary, surgery of, 57  
pulmonary, treatment of, 58  
pure urea in treatment of, 67  
rectal temperature in, 63  
renal, 1261  
respiratory exchanges in, 589  
rest and exercise in treatment of, 825  
sanatorium, 423  
sanatorium and tuberculosis treatment of, 678  
sanatorium, munificent gift for, 186  
serodiagnosis of, 362  
serotherapy of, 433, 1275  
sodium cinnamate in, 732  
statistics of hereditary, 138  
surgical, treatment of, by high frequency current, 738  
surgery and, 353  
temperature fluctuations in, 132  
temperature in, after exertion, 211  
to promote natural processes in, 138  
transmissibility of human, to animals, 283  
transmission of, 134  
treatment of, 353, 538, 547, 977, 1463  
treatment of, with cinnamic acid, 544  
treatment of, with sulphid of allyl, 1121  
voice from Damascus on, 140  
Tuberculous infection, localization of, 1449  
Tubes, tumors of, 209  
Tubo-ovarian abscess resembling appendicitis, 890  
Tumors, 757  
diagnosis of abdominal and pelvic, 927  
etiology factors of, 52  
general pathology of, 676  
histogenetic and comparative study of malignant, 799  
inoperable, 277  
malignant, 205, 538, 1278  
nasal, 765  
trauma in genesis of, 359  
Turck, F. B., gastro-enteroptosis, 1027  
R. C., right cecal hernia, 1075  
Turpentine in infectious diseases, 829  
Two cases of peripheral gangrene associated with localized disease of the arteries, 1370  
uncommon cases of nasal tumors, 765  
Tympantites and phantom tumors, 678  
Typhoid, 65, 281, 489, 534, 673, 732, 972, 979, 1115, 1188, 1273, 1278, 1337, 1408, 1479, 1538  
and appendicitis, differential diagnosis of, 1696  
appendicitis and, 278  
bacilli, early diagnosis of, 679  
bacilli in blood of typhoid patients, 586  
bacilli in feces, 966  
bacilli in sputa, 851  
bacillus, intercellular constituents of, 210  
bacillus, isolation of, 623, 972  
bacteriologic diagnosis of, 277  
case of, 824  
castor oil in, 1404  
chloroform water in treatment of, 1341  
differential diagnosis of, 1300  
diphtheria antitoxin in treatment of, 1548  
early diagnosis in relapse of, 454  
early diagnosis of, by bacilli in blood, 430  
Eberth's bacillus in blood of, 408  
epidemic at Iowa State Agricultural College, 509  
endemics, lessons from, 588  
feeding in, 489  
iliac vein thrombosis after, 838  
in City of Mexico, 1548  
inoculation for, 1408  
kidney complications of, 1402  
mastitis in, 539  
Typhoid, modified treatment of, 708  
patients, solid food for, 140  
perforation, 281, 1466  
prophylaxis of, 1548  
protective inoculation against, 404  
rare complications of, 1010  
specific treatment of, 1048  
spine, 130  
staphylococcus infection, 208  
value of gelatinized urine method of bacteriologic diagnosis of, 623  
Uhlich, C. F., tuberculosis, 1590  
Ulcer, chronic round of stomach, 76  
duodenal, 1116  
duodenal and its surgical treatment, 68  
gastric, 617, 1284  
gastric, indications for operation in, 488  
gastric, operative treatment of, 488  
Ulcerations, uremic, gastric and intestinal, 620  
Ulcer-cancer, pre-pyloric, 208  
Ulcers, growth of epithelium in, 844  
Ulcus cruris, chloronated lime in treatment of, 1603  
rodens, 1677  
Umbilical cord, management of, 1071  
cord, reposition of prolapsed, 338  
Umbilicus, sensory area of, 537  
Uncinariosis, 279, 973  
Undertaking a physician, admissible evidence on, 1591  
Uniformity in state medical organization, plan for, 1456  
Unique case, an, 1695  
United States health service, proposed, 111  
States, hospital and universities in, 1282  
States person examiners meeting, 1455  
University of Michigan, fraudulently obtained papers of, 658  
Unpatentable devices for treatment of disease, 198  
Unprecedented case of constipation, 1304  
Unveiling of the cell, the, 577  
Upper air passages, province of general physician in diseases of, 1466  
Urea estimation, 844  
in treatment of tuberculosis, 67  
Uremia, lesions of myocardium in, 208  
organotherapy in, 517  
therapeutic value of venesection in, 140  
Uremides, 283  
Urethra, new tissue formation in, 902  
reflex in irritable, 659  
transmission of, remote results of surgery in, 1045  
Urethral discharge, 845  
fever, 1192  
Urethritis, chronic posterior, 902  
suprapurals in, 969  
Uric acid, 842  
acid, rapid quantitative test of, 620  
Urine, determining age of infant by, 1120  
fecal matters in, 648  
separation of, 431  
simple bedside test of, 432  
the, in nutritional diseases, 48  
turbidity, cold weather accountable for, 446  
Urinæ, pseudo-fibrinous formation in, 211  
Urticaria, chronic, retarded from healing ear by, after operation, 284  
of upper respiratory tract, 790  
Use and abuse of morphin after abdominal section, 925  
of gall bladder to restore a prolapsed liver, 803  
of tropæ-cocain in spinal anesthesia, 758  
Uses of tuberculin, 366  
Uterine growth, faulty, 613  
prolapse, 1473  
Uterus, bisection of, 1272  
foreign bodies in, 1604  
inversion of, 489  
pathologic status of retroverted, 1176  
rupture of, 361  
rupture of apparent healthy, 187  
rupture of, in cleatrice, 679  
sarcoma of, 1059  
the menstruating, 1276  
Vacations for city people, 1581

## EDITORIALS.

Ability and the size of the head, 1236  
 Abstracts a valuable feature, 587  
 Acid-proof bacilli in non-tuberculous sputum, 1310  
 Adrenal disease, state of the blood associated with, 36  
 Adrenalin, diabetes from injection of, 465  
 Agglutination, improvements in technique of, 1375  
 in mixed infections, diagnostic value of, 1448  
 Albuminuria, functional, 946  
 Alcohol a dangerous food, 651  
 Effect of, on natural immunity, 39  
 therapeutic value of, 878  
 American Association of Pathologists and Bacteriologists, meeting of, 876  
 Medical Association, next annual meeting of, 1011, 1232  
 medical literature, 179  
 Society of Naturalists and Affiliated Societies, 109  
 Anemia, splenic, with ascites, 111  
 Animal experimentation and the antivivisectionists, 880  
 Annual meeting, American Medical Association, 1447  
 Antidiphtheric serum, value of, 652  
 Antitoxin in treatment of diphtheria, 1008  
 Antivaccination, object lesson in, 518  
 Antivivisectionists, animal experimentation and, 880  
 Appendicitis and infectious diseases, 181  
 Arsenic as normal constituent of tissues, 711  
 relation of, to alcoholic neuritis and beri-beri, 827  
 Ascites, splenic anemia with, 111  
 Athyroidism, functional, 650  
 Auto-nephrotoxins in operations upon the kidneys, 254  
 Balantidium coli (Stein) in intestinal diseases, 1234  
 Barber shops, hygiene of, 589  
 Baths, influence of various, on gaseous interchange, 1581  
 Bibliographia Medica, the, 112  
 Biliary acids, Hay's reaction for, 1085  
 Blood examination, value of, in differentiation of typhoid and malarial fevers, 1374  
 Boxing, English view of death from, 769  
 Cacodylates, therapeutic value of, 1086  
 Canadian Ananias, a, 1310  
 Cancer, cervical, early diagnosis of, 518  
 etiology of, 180, 711  
 Catarrhal inflammation of middle ear as a factor in the production of facial palsy, 1375  
 Chancre, bacillus of soft, artificial susceptibility toward, 253  
 charlatanism and cheek, 403  
 Cheese, tubercle bacilli in, 1012  
 Children, amebic dysentery in, 253  
 Church hygiene, 1448  
 City children during the summer, 1580  
 Club practice, medical, 328  
 Cocain habit, the, 38  
 Colleges combine, two more, 1011  
 Colorado's attitude toward consumptives, 1164  
 Commercialism in medical education, 879  
 vs. sanitation, 945  
 Constitution for state societies, proposed, 1163  
 Consumptive health-seekers, barring of, 254  
 Consumptives, Colorado's attitude toward, 1164  
 Coroner's jury and Eddyism, wise, 465  
 Credulity and medicine, 828  
 Czeizler, responsibility of, 252  
 Degeneracy, legislation against, 462  
 Degeneration, glandular, of red blood cells, 326  
 Dentists, physicians and, 327  
 Diabetes as manifold disease, 402  
 from injection of adrenalin, 465  
 pancreas in, 1518  
 Diphtheria bacilli and noma, 326  
 treated with antitoxin, 1008  
 Disinfection and health departments, 828  
 Domestic animals and infectious diseases of man, 1520  
 Dysentery, acute, in United States, 590  
 amebic, in children, 253  
 experimental, 36  
 Edema, angioneurotic, 179  
 Embalming, relation of physician to, 1519  
 Employment as therapeutic agency in public institutions, 1447  
 Endocarditis, varieties of, 1692  
 Eskridge-Parkhill memorial, the, 1164  
 Examining board, a national not a local, 1376  
 Exhibit of Pathological Society of Philadelphia, 1085  
 Eyesight of children, 1582  
 Fame, fraudulent use of another's, 1011  
 Family physician, modern, in large cities, 1372  
 Farm colonies and tent life for the tuberculous, 464  
 Fee, division of, 329  
 Fenger, Christian, 769  
 Ferments in pathology, 766  
 Fibrin ferment in milk, 1309  
 Fireplaces, unprotected, danger of, 588  
 Fluorescence in malaria, curative action of, 1581  
 Foreign current medical literature, 255  
 Formalin in tuberculosis, 767  
 Forwood, Surgeon-General, 1627  
 Fourth disease, the, 1165  
 Fraternal unity, dawn of, 650  
 Future woman, the, 829  
 Gas leakage in large cities, 1579  
 Gelatin as food and therapeutic agent, 1444  
 Girls, growing, effects of schools on health of, 1162  
 Glycerinated vs. dried vaccine virus, 1306  
 Gregory, testimonial banquet, 1085  
 Gynecology for insane, 1086  
 Hahnemannism extraordinary, 254  
 Hair, whitening of, 178  
 Harvard Cancer Committee, second annual report of, 1083

### MEDICOLEGAL.

Abortion case, circumstantial evidence in, 420  
 Accidents, communications to physicians about, 667  
 Admissible evidence of undertaking of physician, 1591  
 Admission to hospital, refusal of, 785  
 Allowing physician to publish article in case, 1397  
 Anesthetics, deaths from, under insurance policy, 1533  
 Board of health, number of physicians allowed on, 532  
 of health record, 1033  
 of medical examiners, court can not supplant, 199  
 Cause of first fracture that also of rebreaking leg, 1103  
 Charging wrong person, 726  
 Communications to company's physician privileged, 1670  
 to physicians about accidents, 667  
 Compulsory vaccination, state board of health and, 1270  
 County health officer, duty of city to pay, 1178  
 Curettement, 1327  
 Deadly drug, mistake in furnishing, gross negligence, 667  
 Death from anesthetics under insurance policy, 1533  
 Describing pneumonia as cold, 348  
 Diphtheria, authorized means to prevent spread of, 1327  
 Doctor's bill, promise of third party to pay, 273  
 Drugs, mistakes in sale of, liability to users for, 1534  
 Electricity, who is expert on effects of, 667  
 Employing physician, 273  
 Employment of physician, ratification of, 127  
 of surgeon by trainmaster, 1032  
 Epidemic, power of board to employ physicians during, 60  
 Evidence derived from test of extent of injury, 1469  
 Examining physician's statement, 273  
 Exhumation and autopsy months after death, 199  
 Expert fees, 726  
 evidence and testamentary capacity, 609  
 testimony, 840  
 Experts for state, examinations made by, 1103  
 Extent of injury, evidence derived from test of, 1469  
 Eye, injury to, 609  
 Fracture of ankle bone and septic pneumonia, 475  
 Frigate, recovery for physical injuries caused by, 1468  
 Furnishing physician, 273  
 Health officer, authority required for appointment of, 962  
 Hearing before board of health, entitled to, 1104  
 Hospital surgeons, privileged communications to, 60  
 or trustees not liable for surgeon's negligence, 1670  
 Illinois medical practice act and osteopathy, 962  
 Inadmissible evidence, 1270  
 Infant, medical services for, 726  
 Injured employee, neglect of, 1178  
 person taken to hospital against his will, 609  
 persons, duty of company assuming charge of, 127  
 persons, statements of, of physicians, 961  
 Injury, aggravation of, by not observing instructions, 1178  
 followed by quick consumption, 199  
 to the eye, 609  
 to physician's business, damages for, 1033  
 Insanity, the law of, 532  
 Inspection of laundries a proper health measure, 1670  
 Intent of physician, opinion of patient as to, 348  
 Liability for failure to furnish medical assistance, 475  
 for refusal of admission to hospital, 785  
 to users for mistakes in sale of drugs, 1534  
 Louisiana medical practice act not unconstitutional, 475  
 Malpractice, anticipating injury from, 1327  
 case, burden of proof in, 840  
 case, difference in, on second trial, 894  
 case, skill and contributory negligence in, 609  
 effect of prior condition on action for, 420  
 damages, 840  
 Medical assistance, liability for failure to furnish, 475  
 authorities, cross-examination from, 667  
 experts, use and criticism of opinions of, 1670  
 practice act, constitutionality of, 1327  
 examiner, agency of, 895  
 witnesses, court not entitled to introduce, 609  
 Non-resident, township not liable for medical services for, 348  
 North Carolina law, privilege under, 199  
 Oculists as physicians, care required of, 726

 Urethritis, gonorrheal, 1032  
 Urine, incontinence of, 1326  
 Vaginismus, 1177  
 Vaginitis, gonorrheal, 839  
 Vomiting, uncontrollable, 1105  
 Warts, 475  
 Worms, 1105

# CURRENT MEDICAL LITERATURE

## INDEX OF TITLES

Explanation: This index covers titles and subjects of original articles published in most of the leading medical journals of the world during the past six months. The titles, and the journals in which they appeared, were published weekly in the Current Medical Literature department, to which references are made. The figures in ( ) refer to the paragraph; the number following, to the page in The Journal. For instance, "Abdomen, gunshot wounds of, (60) 61" refers to page 61 of The Journal, on which is found opposite paragraph 60, the title of paper and name of author, viz., "Gunshot Wounds of the Abdomen. Edmund D. Clark." This title is listed under the journal in which the article appeared: "Indiana Medical Journal, December." Titles of articles which appeared in The Journal are indicated by an asterisk (\*) before the page number.

- Abasia, (17) 349
- Abdomen, gunshot wounds of, (60) 61, (151) 534, (97) 350, (137) 964
- wounds of, (5) 421, (106) 1272
- Abdominal cases in women, some, (67) 1535
- cavity, bougie removed from, (20) 727
- cavity, reducing size of, by doubling abdominal wall, (41) 483
- contusions associated with rupture of intestine, (79) 963
- incision, closure of, (18) 533
- inflammation, grave, quiescent or latent period in, (3) 1476
- injuries, grave, without external evidences of traumatism, (84) 477, \*1302, (46) 1398
- lesions, diagnosis in, (145) 1035
- muscles, congenital absence of, (43) 61
- operations, accidents and complications following, (117) 1535
- operations on women, few, (148) 1035
- operations, report of, (79) 723
- operations, technic in, (41) 1106
- organs, valuable points in diagnosis of diseases of, (25) 727
- pain, significance of, (12) 668, (24) 727
- palpation in diagnosis of diseases of stomach and pylorus, (128) 728
- section, (83) 61, (63) 274, (56) 896
- surgery, advance in clinical symptomatology in relation to, (150) 477
- surgery, cases in, (90) 971
- typhus, treatment of, (86) 668
- typhus, Hygiene and Diagnosis of, (97) 1179
- wall, complete relaxation of, under anesthetics, (12) 1675
- wall, spontaneous rupture of, (114) 350
- wall, suture of, (76) 963
- Abiotrophy, (7) 1186
- Ablatio placentae, (64) 128
- Abnormal physical conditions in children, some, (9) 1335
- Abortion, artificial, in pelvic deformity, (22) 1701
- criminal, (27) 421, (68) 668, (117) 669
- criminal, in extrauterine fetation, (37) 274
- modern indications for, especially in tuberculosis, (62) 904

 lingual, (153) 201  
 Hemicephalia and hereditary syphilis, (91) 904  
 Hemichorea and parotitis complicating diabetes, (15) 276  
 Hemihypertonia postpapilloplectia, (53) 1398  
 Hemiparesis, hysterical, with Bell's palsy, case of, (92) 1034  
 Hemiplegia associated with complete hemianesthesia and unilateral muscular atrophy, (95) 350  
 hysterical, treated with suggestion, (31) 200  
 Infantile, (99) 1406  
 problem of, (54) 1676  
 with aphasia, (65) 200  
 varieties and treatment of, (41) 1535  
 Hemiplegic contraction, etiology and physical treatment of, (58) 541  
 Hemoglobin, escape of, from corpuscles treated with sublimate, (104) 1477  
 from blood corpuscles, escape of, (58) 617  
 Hemoglobinuria, (63) 1187  
 basophilic granulations in reds in, (131) 1043  
 Hemolymph gland of sheep and goat, changes in, produced by splenectomy, (86) 1470  
 Hemolysis, demonstration of, (157) 1536  
 practical application of, (41) 1541  
 by salts, checking, (61) 541  
 experimental study of, (63) 356  
 produced by certain bacteria, (12) 674  
 Hemolytic experiments, methods of conducting, (11) 674  
 substances, (30) 541  
 Hemophilia, remarkable loss of weight in, (70) 728  
 treated with calcium chlorid, (13) 1476  
 Hemoptysis, (54) 1034  
 parasitic, (58) 1271  
 treated by subcutaneous injection of gelatin, (56) 617  
 treatment of, (138) 1406  
 tuberculous, treatment of, (79) 1600  
 Hemorrhage, (143) 422  
 case of, persisting notwithstanding curettage, (10) 1106  
 cerebellar, (50) 533  
 cerebral, (101) 963  
 cerebral, management of, (22) 610  
 fatal, in chronic portable congestion, (101) 1406  
 gastric, and perforation, surgery of, (46) 200  
 gastric, is operation indicated in, (112) 1043  
 puerperal, (14) 1534  
 puerperal, after-care of, (32) 1405  
 resulting from caries of temporal bone, (130) 1406  
 secondary, on fifth day after tonsillotomy, (141) 1471  
 severe vaginal, (153) 129  
 treated with suprarenal capsule, (30) 200  
 urethral, in gonorrhea, (13) 1675  
 uterine, galvanism as remedy for, (119) 534  
 Hemorrhages, alveolar, during pregnancy, (64) 476  
 from rupture of pregnant tube, (10) 483  
 nasal and uterine, method of controlling, (112) 728  
 Hemorrhagic diathesis, the, (89) 1179  
 typhoid fever, (20) 421  
 Hemorrhoids, after-treatment for operations for, (60) 1671  
 considerations of operations for, (38) 610  
 injection treatment of, (96) 61  
 operative treatment of, (55) 1271  
 internal, new method of removal of, under local anesthesia, \*1076  
 Hemorrhoids, internal, treatment of, (5) 962  
 new operation for, (118) 611, (31) 1541  
 results of Langerbach's operation for, (79) 1279  
 treated by arsonization, (64) 736  
 Hemostasis, electrothermic, in vaginal hysterectomy for cancer, (20) 1534  
 of the broad ligament, \*1501  
 Henoch's purpura, case belonging to erythema group of, (7) 1328  
 Hepatic insufficiency, (20) 841

 Ulcers, general remarks on treatment of, (141) 422  
 rate of growth of epithelium of, (27) 841  
 Ulcus cruris, chlorinated lime in treatment of, (40) 1600  
 rodents cornae, (54) 1535  
 rodents, diagnosis and clinical history of, (25) 1675  
 Ultra-violet light, (9) 540, (6) 970  
 Umbilical cord, management of, (89) 896, \*1071  
 vein, double rupture of, (77) 1405  
 Umbilicus, sensory segmental area of, (36) 533  
 Uncinari Americana, (1) 1398  
 Uncinariasis, (76) 275  
 Uncooked milk in atrophy and gastro-intestinal catarrh in nurslings, (50) 483  
 Unfriendliness among doctors, (94) 963  
 Unique case, report of a, (129) 1593  
 United States Army, history of medical department of, (79) 668  
 University ear department, ten years' work of, (79) 1535  
 hospital, reasons why there should be a consumptive hospital in connection with, (115) 1535  
 of Toronto, new medical building of, (84) 1593  
 Unna's plasma-cells, study of, (53) 356  
 Upper respiratory tract, morbid conditions of, (29) 1535  
 Upton Scott, (78) 1106  
 Urea estimation, value of, (31) 841  
 Uremia, dyspneic coma in, (75) 1600  
 physiology of, with its bearing on dietetics and treatment of, (56) 1034  
 treated by venesection, (54) 903  
 Ureter, catheterization of, (29) 1405  
 complete double, of each side, (162) 1536  
 cyst formations in, (71) 1336  
 cysts of, (4) 1328  
 nephrotomy, with drainage of right, (91) 1179  
 obliteration of, and consecutive cystic degeneration of kidney, (122) 1478  
 obstruction of, (69) 1271  
 Ureteral catheterization, work in, (154) 201, (54) 356  
 surgery, cases illustrating, (71) 275  
 Ureters, method of treating, severed during abdominal operations, (74) 1034  
 topography of, (101) 350  
 transplantation of, into rectum for exstrophy of bladder, (76) 1034  
 Urethra, male, pointers on, (126) 275  
 new tissue formation in, (101) 896  
 stricture of, (101) 129, (79) 1271  
 surgical intervention in laceration of, (18) 1041  
 Urethral discharges, (73) 841, (67) 1279  
 fever, bacterial invasion of circulation cause of, (76) 1187  
 reinfection, posterior, from bladder, (95) 668  
 sound, vibrating, (69) 1187  
 Urethritis, chronic, non-gonorrheal, (59) 903  
 chronic, treated by extract of suprarenal capsule, (86) 963  
 eosolate of silver for, (44) 668  
 impotency due to, (100) 896  
 neurasthenic, (158) 129  
 non-gonococcic, (85) 1600  
 post-gonorrheal, bacillus coli in, (32) 1600  
 Urethrotomy, (114) 275, (147) 897  
 Uric acid, (3) 841

- Uric acid and xanthin bases, relation of, to gout, (15) 1328  
acid, clinical odds and ends of, (100) 350  
acid diathesis, (99) 350, (153) 669  
acid in urine, rapid test of quantity of, (44) 617  
acid poisoning, treatment of, (134) 62  
acid, some evils of, (75) 668  
Uricacidemia, hay fever, and asthma, (110) 1671  
Urinalysis in children, (44) 1671  
in gynecic surgery, (45) 1671  
Urinary analysis, (147) 964  
bladder, on association of stone and tumor of, (69) 1034  
deposit, undescribed, (12) 1404  
fever, (136) 842  
infections, permanent source in treatment of, (22) 1113  
sediment, staining, with sodium alizarin-sulphonate, (53) 675  
Urine, albumin in, (32) 1535  
analysis, in determining age of neonatorum, (92) 1113  
as a soil for bacterial growth, (107) 534  
disturbances in evacuation of, (71) 1279  
examination of, (105) 1593  
examination of, for life insurance, (130) 1329  
from ureters without catheterization, to separate, (31) 428  
gelatinous, (79) 1701  
in genito-urinary diseases, study of, (46) 1671  
in young children, study of, (43) 1671  
incomplete retention of, in stricture of male urethra, (115) 963  
information to be derived from, in nutritional diseases, (5) 483  
soaps of lime and magnesia in, (24) 610  
tests of antiseptics for, (71) 1542  
turbidity of, cold weather accountable for, \*446  
what can be learned by study of, without a microscope, (73) 61  
Urobilinuria in pregnancy, (90) 1405  
Uro-genital tract, senile changes of, (148) 964  
Urologist, notes of, (157) 1478  
Urology, application of, in the clinic, (62) 1405  
Urotropin in enuresis, (80) 422  
in pyuria, notes from use of, (75) 1671  
in typhoid bacteriuria, (84) 736  
Urticaria of upper respiratory tract, (40) 786  
pigmentosa, (48) 1541  
thyroid extract in, (116) 1107  
Uterine adnexa, treatment of inflammatory conditions of, (39) 1535  
appendages, suppuration in, (15) 963  
displacements complicating pregnancy, (4) 1534  
displacements, suspension and fixation for, (88) 786  
displacements, prevention of, (122) 477  
Uterus and bladder, topography of, after Alexander-Adams operation, (48) 617  
and broad ligaments, fibroids of, (85) 1535  
and vagina, medical treatment of diseases of, (63) 1698  
bicorns, twin pregnancy in, (127) 1043  
bipartitus, twin pregnancy in a, (24) 1179  
cancer of, (132) 422, (133) 477, (39) 1179  
classification of displacements of, (104) 484  
curettage of puerperal septic, (6) 421  
defective development of, (56) 476, (19) 610, (28) 1278, (98) 1470  
didelphys found with pyosalpinx, (57) 476  
fetal, bone focus in cervix of, (74) 675  
fibroid tumors of, (135) 1035  
foreign bodies in, (59) 1690  
gravid, stab wound of, (124) 1035  
in cystocele operations, plastic use of, (16) 274  
incarceration of, in ring pessary, (99) 1477  
Uterus, instrumental perforation of, (168) 1593  
inversion of, (83) 477, (20) 610, (7) 1541  
median incision of, in total extirpation, (47) 617  
measuring, anatomy of, (65) 1241  
new method of bisecting, (4) 1271  
operation for congenital absence of, (38) 421  
operations on, (86) 1042  
pregnancy, myomectomy upon, (106) 275  
primary carcinoma of body of, (122) 963  
progress in treatment of malignant disease of, (69) 736  
retrodisplacements of, two methods of operating for, (35) 963  
retroflexion of, (118) 1107  
retroversion and retroflexion of, (46) 963  
round ligament ventrosuspension of, (19) 200  
rupture of, in cicatrices, (47) 675  
treatment of rupture of, (66) 356  
Uvula, supernumerary, (84) 1671  
Vaccination, (51) 786, (149) 787, (29) 1106  
and common sense, (1) 1335  
and smallpox, (15) 476  
comparative merits of, (101) 1034  
compulsory, essential, (13) 1179  
fatal, which resembled appendicitis, (34) 427  
from standpoint of surgeon, (38) 1479  
in relation to skin disease, (24) 427  
is it what it should be, (148) 534  
of 1,060 adults, results of, (9) 1112  
question of, (5) 476  
various methods of, (3) 895  
what constitutes efficient, (66) 1179  
Vaccinations, history of six, (49) 1034  
Vaccine, micro-organisms of, (121) 1114  
propagation of, from calf to calf, (98) 1187  
virus, \*217  
virus with reference to danger of glycerinated lymph, (173) 534  
Vaccinia generalisata, (78) 668  
genuine, characteristics of, (98) 209  
tetanus appearing in course of, (99) 200, (150) 534, (92) 668, \*1222  
Vaccinium vitis-idae therapeutic value of, (92) 1336  
Vagel, effect of severing and mechanically irritating the, (72) 1034  
Vagina, atresia of, (95) 1671  
complete absence of, (109) 1593  
congenital malformation of, (7) 274, (82) 1042  
section, (121) 1329, (92) 1399  
Vaginitis, gonorrheal, new treatment of leucorrhea and, (56) 61  
Vagino-fixation, complicated birth after low, (81) 1042  
Vagitus uterinus, case of, (76) 1042  
Vagus reflex, the, (29) 349  
Valedictory, University of Louisville, (35) 1398  
Valve, ileocecal, frequency of, (75) 1542  
Valvular heart disease, physical and dietetic treatment of, (17) 1534  
lesions of heart, (131) 1471  
Vanadium, biologic study of, (109) 1114  
Vapor massage, (116) 1329  
Varicose veins, etiology classification of, (35) 1106  
veins of right upper extremity in child, (161) 1593  
Variola in fetus without traces of it in mother, (141) 1478  
observations about, (125) 1107  
or smallpox, (21) 610  
Variolation in French colonies, (19) 1186  
Variolization, the, (160) 1406  
Vasa deferentia, severing of, (14) 786  
Vascular system after death by asphyxia and cardiac failure, (6) 1112  
Venereal disease, contagion of, (21) 1335  
disease, notes on, (44) 841  
disease, prophylaxis of, (41) 1405  
disease, report of committee on prophylaxis of, in New York City, (5) 60, (34) 61, (6) 128  
diseases, circumcision and, (139) 422  
diseases, directions to sufferers from, (11) 1671  
diseases, problems concerning, (13) 1671  
diseases, prophylaxis of, (30) 903, (39) 1113, (117) 1114  
ulcer, treatment of, with cold, (66) 1542  
Venesection, critical-historical essay on, (29) 903  
uremia treated by, (54) 903  
Venom and antivenene, (5) 610, (18) 668, (30) 727, (23) 786, (21) 841  
Ventrofixation, (9) 727  
and ventral suspension in subsequent pregnancy and labor, (5) 274  
Ventrosuspension, round ligament of uterus, (19) 200  
of uterus and ovaries, operation for, (109) 728  
uterine, new operation for, (123) 62  
Venous pulse, dissociated, (81) 1477  
pulse, observations on, (58) 1477  
Vera Cruz, crime of, (47) 533  
Veratrum in pneumonitis, (95) 963  
viride, notes on treatment of, (108) 1107  
Vermiform appendix, the, (84) 1106  
appendix, are seeds potent factors in production of disease in, (36) 1034  
appendix as cause of intestinal obstruction, (19) 1534  
appendix, foreign bodies in, (84) 841, (91) 1593  
appendix, reasons for considering a gland, (11) 1469  
Vertigo, malarial, (84) 1336  
psychic, (49) 1676  
Vesical capacity, note on gauging, \*391  
emergencies, (88) 200  
Vesico-vaginal fistula cured by method believed to be new, (5) 1541  
Vessels from yellow fever ports, treatment of, (25) 533  
Veterinary medicine and public health, (29) 476  
Villi, deportation of, (78) 1042  
Vincent's angina and stomatitis, contagion of, (36, 37) 1476  
angina, cure of, with methylene blue, (23) 428  
Virchow, Rudolph, (125) 129  
Virus, filtration of, (21) 735  
Viscera, complete transposition of, (145) 669  
Vision, peculiarity of, (36) 1106  
Visual acuity, economic limitation of, in various trades and professions, \*380  
center, apoplexy in, (37) 963  
defect, what amount of, should disqualify in railroad service, \*382  
system, complete absence of, in adult, (75) 728  
test, criticism of, used in British army, (16) 970  
Vitiligo, extensive case of, (77) 728  
Vitreous humor, origin of, (117) 1478  
Vocal nodules, (99) 61  
Volkmann's contracture, (4) 356  
Voluntary Board of National Examiners, a, \*1215  
Vomiting, hysterical, in children, (43) 970  
in infancy and childhood, (111) 1107  
in pregnancy, pernicious, (91) 841  
of pregnancy, case of, (128) 1672  
of pregnancy, treatment of, (49) 507, 786  
with tracheotomy tube in situ, (63) 421  
Von Helmholtz, Hermann, the inventory of the ophthalmoscope, \*552  
Von Mansfelde, Alexander S., (124) 201  
Voltaization, tests of, (51) 483  
Vulvovaginitis, gonorrheal, in young children, (2) 274  
infantum, (72) 1113  
Walking apparatus for paralytics, (98) 971  
Warrior microbe, (75) 1271  
Water bath in typhoid, (94) 200  
itch, or sore feet of coolies, (16) 1186  
supply, (112) 787  
supply, problem of safe and adequate, for twin cities, (129) 842  
Weak ankles of children, misapplied mechanical support of, (83) 963  
Wearing apparel, new, and hygienic, (38) 476  
Weighted vaginal speculum, danger from use of, (19) 1469  
Weil's disease, with delirium grave, (105) 275  
Welder's treatment of syphilis, (98) 1336  
Well-tried combination, a, (170) 611  
What should the patient know about his disease and treatment? (35) 1592  
Whisky, injurious constituents of, (8) 1700  
White corpuscles in suppurative processes, behavior of, (85) 1405  
corpuscles in surgical affections, behavior of, (64) 1541  
Whooping cough, (96) 129  
cough and quarantine, (44) 1106  
cough, formol in, (48) 785  
cough, modern treatment of, (122) 669  
Why doctors disagree, (42) 963  
Widal reaction, remarks on some experience with, (28) 963  
Will, the, (85) 1187  
Wills of lunatics, notes on, (94) 275  
Winkelmann's hydrocele operation, (27) 1690  
Windpipe, nail in, (112) 62  
Witch, thou shalt suffer no, to live, (95) 1271  
Woman physician in the country, (63) 668  
Woman's Hospital reports, (153) 129  
Womb, treatment of retrodeviations of, (112) 201  
Women, gonorrhea in, (29) 421  
in Russia, history of medical education of, (128) 1329  
Wood-Holmes introducer for tamponing uterus post-partum, (31) 349  
Word-blindness, cases of, (14) 616  
Work in hysteria and neurasthenia, therapeutic value of, (59) 1592, (43) 1470  
Worm, lumbricoid, in intestine causing fever in puerperium, (71) 128  
Worms in intestines, (133) 534  
two new nematoid, (40) 675  
Wounds of diaphragm, study of, (6) 483  
perforating abdominal, (142) 964  
treatment of, (60) 1271, (97) 1535  
Wrench, new, for use in correction of stubborn deformities, (109) 201  
Wryneck, combination of high scapula and, (79) 1336  
spasmodic, in case of exophthalmic goiter, (77) 1470  
Xanthin bases, uric acid and, (15) 1328  
X-light, notes on, (31) 61, (36) 274, (34) 421, (31) 1271  
X-ray and dissection of arteries, (117) 422  
burns, accidental, (18) 786, (22) 841  
diagnosis and operation in injuries for foreign bodies in the eye, (16) 476  
determining limits of frontal sinus, \*764  
image of, from medico-legal standpoint, (15) 421  
in diagnosis and wiring in treatment of fractures, (23) 610  
in diagnosis of certain surgical cases, (149) 275  
in fractures and dislocations, (134) 201

- X-ray in treatment of cutaneous epithelioma, (2) 421  
 lupus erythematosus cured by, (122) 129  
 burns, notes on, (58) 128  
 sarcoma and Hodgkin's disease treated by, \*166  
 therapy, technique of, (49) 668  
 treatment of malignant growths by, (1) 785  
 and lupus and epithelioma, (92) 841
- X-ray in diagnosis of stones in kidney, (78) 1113  
 in treatment of cutaneous cancer, (110) 963  
 in so-called sprains, (17) 421  
 on callous sinuses of abdominal walls, effects of, (6) 1675  
 roden ulcer treated by, (3) 1186  
 therapeutic employment of, (5) 1675  
 therapeutics of, (142) 534
- Yellow fever, agreement between the history of, and its transmission by culex mosquito, \*993  
 fever and quarantine regulations, on transmission of, (20) 128  
 fever, are vessels infected with, (12) 895  
 fever, etiology of, (21) 668  
 fever fomites, experiments with, (86) 1399  
 fever, infectious agent of, (2) 785
- Yellow fever, mosquito theory of, (114) 971  
 fever, note on spread of, (15) 1186  
 fever of U. S. of past does not sustain mosquito theory, (142) 275, (118) 350  
 fever, propagation of, by mosquitoes, (23) 200  
 Yohimbin, hypodermic injection of, (67) 1676  
 Young physician, the, (5) 895

# CURRENT MEDICAL LITERATURE

## INDEX OF AUTHORS

This Index includes the names of authors of articles which have appeared in this journal, as well as of those listed under Current Medical Literature. This practically includes the names of those who have published articles in most of the leading journals of the world. The \* preceding the page reference indicates that the article appeared in full in THE JOURNAL.

- Aaron, C. D., (128) 728, (56) 1671  
 Abbe, R., (26) 963  
 Abbott, A. W., (53) 274, (54) 668, (41) 1106, (47) 1398  
 Abbott, G. E., (14) 349  
 Abel, J. J., (45) 61, (81) 786  
 Abell, I., (78) 1271  
 Abrahams, R., (13) 1534  
 Abrams, A., (14) 533, (14) 610, (15) 727, (10) 895, \* 1142, (43) 1271, (68) 1328, (51) 1470  
 Abt, I., (40) 727, (51) 1698  
 Abt, I. A., (39) 1671  
 Achard, C., (26) 1113, (32, 33) 1476, (40) 1477  
 Acker, G. N., (62) 727, (109) 1329  
 Acland, T. D., (17) 1186, (1) 1335  
 Adam, G., (161) 422  
 Adam, J., (8) 793  
 Adam, J. G., (16) 668, (83) 841, (29) 1698
